Ontypology

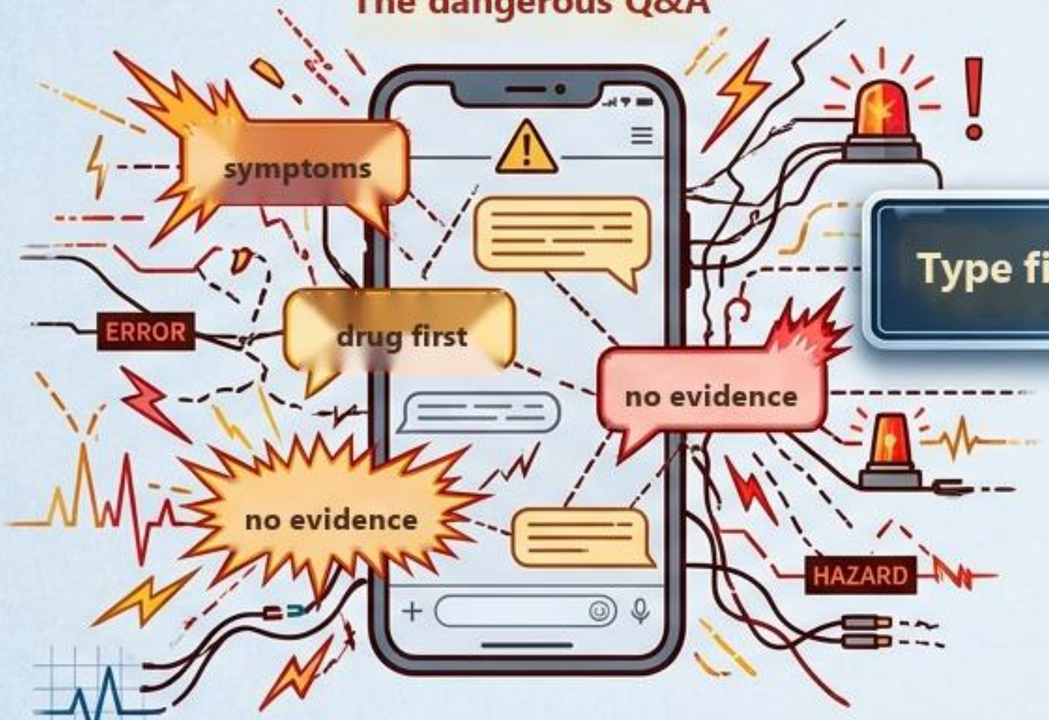

- From difference to division, from division to type, from type to understanding – the brain has walked this path for aeons.
- A century ago, logic was philosophy; once seen clearly, it became an established science.
- Today we explore "Type" (a brain concept) as philosophy; Ontypology makes "Type" clear, turns it into an established science, and puts it into practice as Mind AI.

AI Western Medicine Consultation & Prescribing

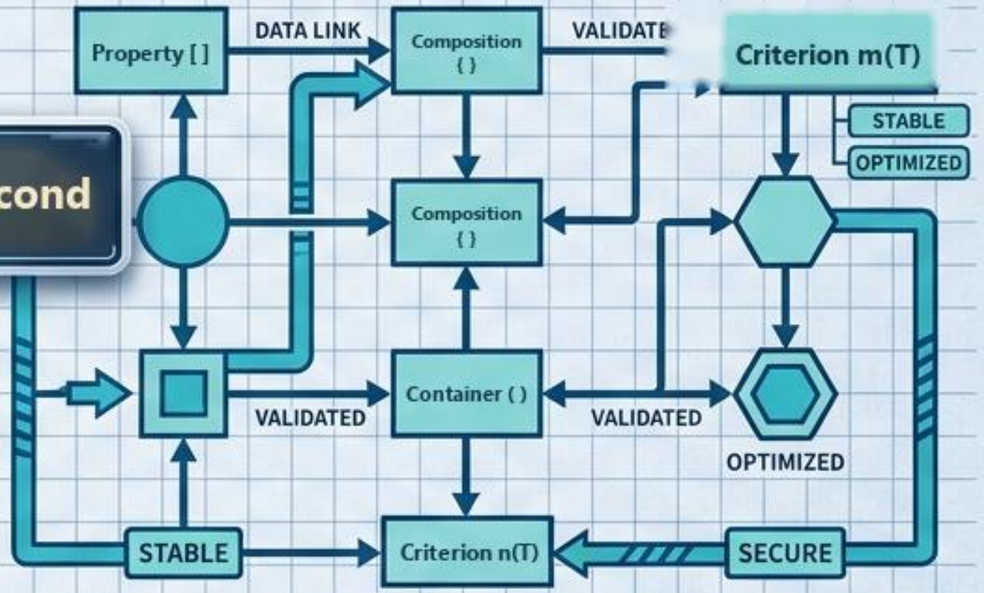

Building a reasonable medical replica

The dangerous Q&A

Type first, Number second

The reasoning replica

A record is worth nothing written down and everything when it can be used. AI Western-medicine consultation is not a chatbot: it maintains a medical structure replica in which every output is accurate, checkable and traceable.

Mind AI System Architecture: Language and Wisdom, Divided

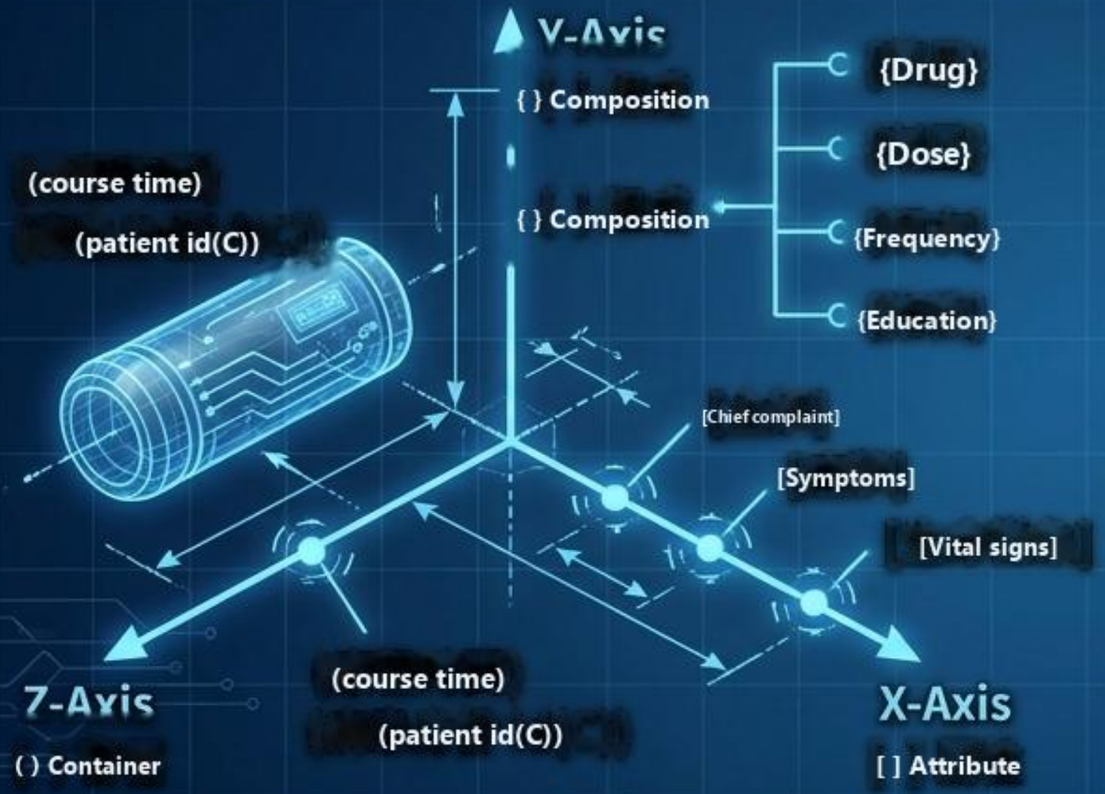

“Type” — building the structure	“Number” — filling in the values
Answers “what it is and what it is made of”. E.g. the four-part prescription BOM, bacterial tonsillitis.	Answers “how much”. E.g. temperature 38.4 °C, Penicillin 500 mg.

MIND AI

System Computing Physics: Space Type and Time Type

Space Type

Time Type

One complete consultation = one space structure + a chain of time moves.

MIND AI

The Six Output Types at a Glance: One Rigorous Line

Consultation Type
chief complaint & history

Examination Type
physical findings

Lab Type
data interpretation

Diagnosis Type
differential & confirmation

Prescription
the prescription slip

Follow-up Type
the subsequent course

Accept: all fields present, verbatim kept

Accept: negatives recorded too

Accept: criteria first, then read

Accept: the funnel converges

Accept: components trace to pathology

Accept: same container, identity unchanged

clinical evolution

⚠ **Each Type is the input to the next; each Type is the acceptance of the previous one.**

MIND AI

The First Three Types: Turning What You Hear into a Computable Structure

Consultation Type

Sore throat 3 days, no cough, worse on swallowing

1. [CC]: sore throat × 3 days
2. [HPI]: worse on swallowing
3. [ROS]: no cough → negative evidence

Examination Type

- ☑ erythema
- ☑ exudate
- ☑ no dyspnoea

Negative findings: the key to ruling out emergencies

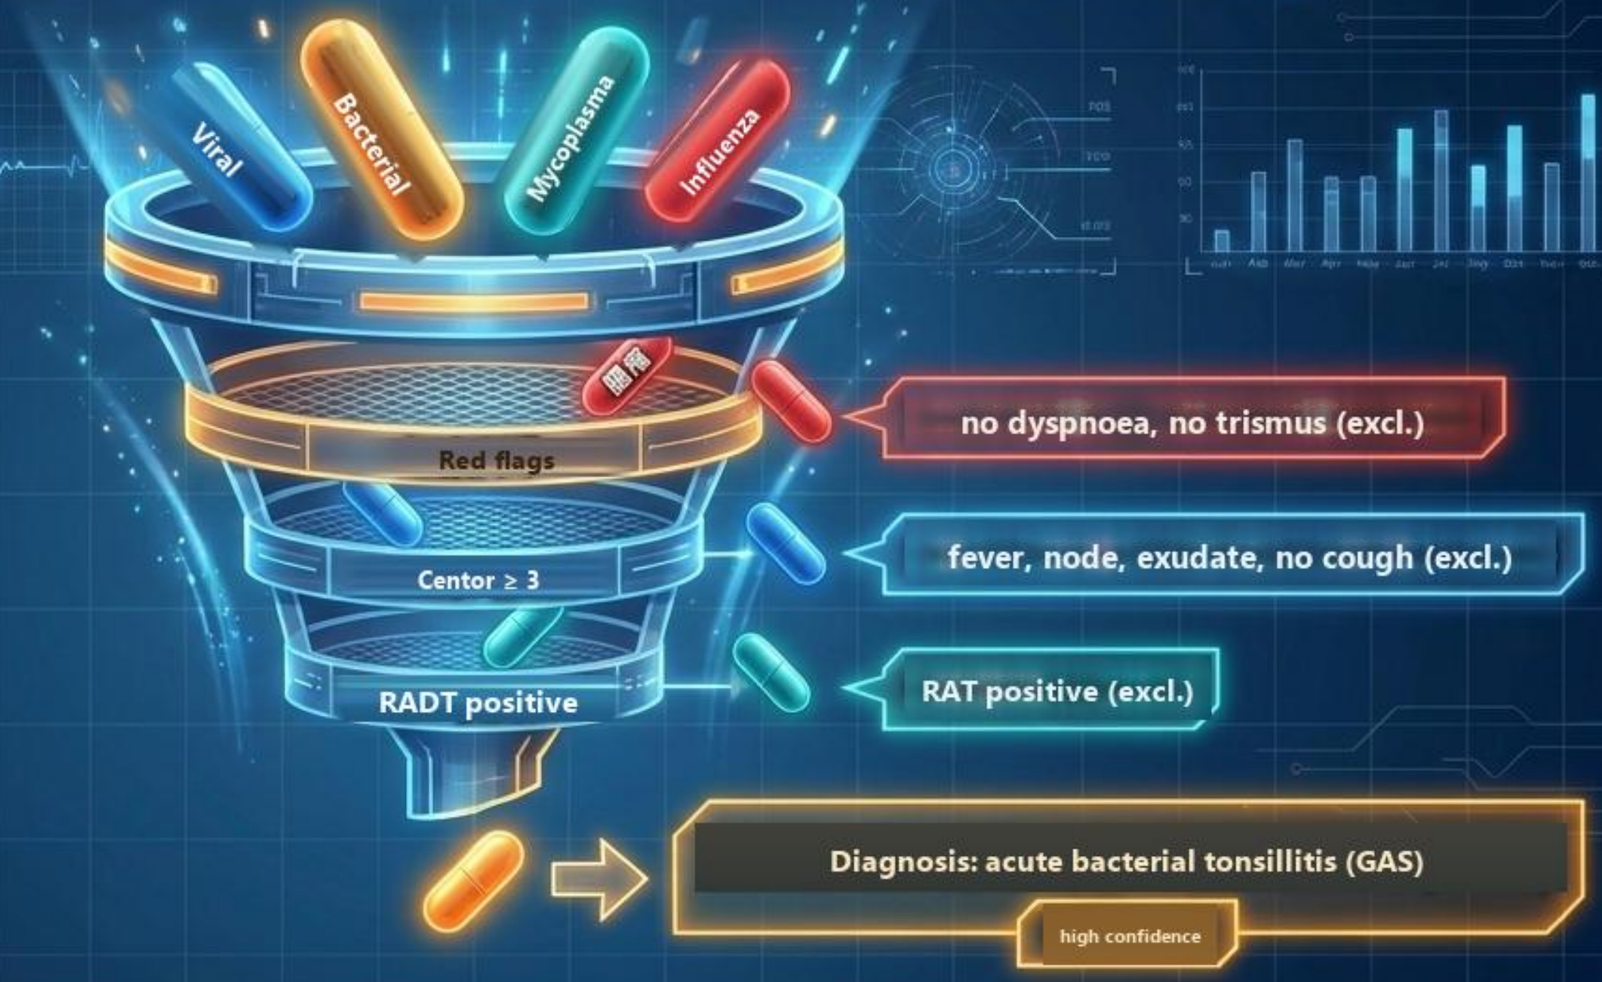

Lab Type

1. Write the criterion (Rule: >37.8 °C = fever)
2. Fill in the data (Data: 38.4 °C)
3. Conclusion (Result: supports infection)

⚠ Never read the data first and patch the criterion in afterwards. Reverse the order and the reasoning fails.

MIND AI

Diagnostic Funnel ∩(T): differential is rigorous exclusion, not guesswork

Every layer's convergence must record “what was excluded, and why”.

MIND AI

Prescription Structure: One Prescription Slip Is One Rigorous BOM

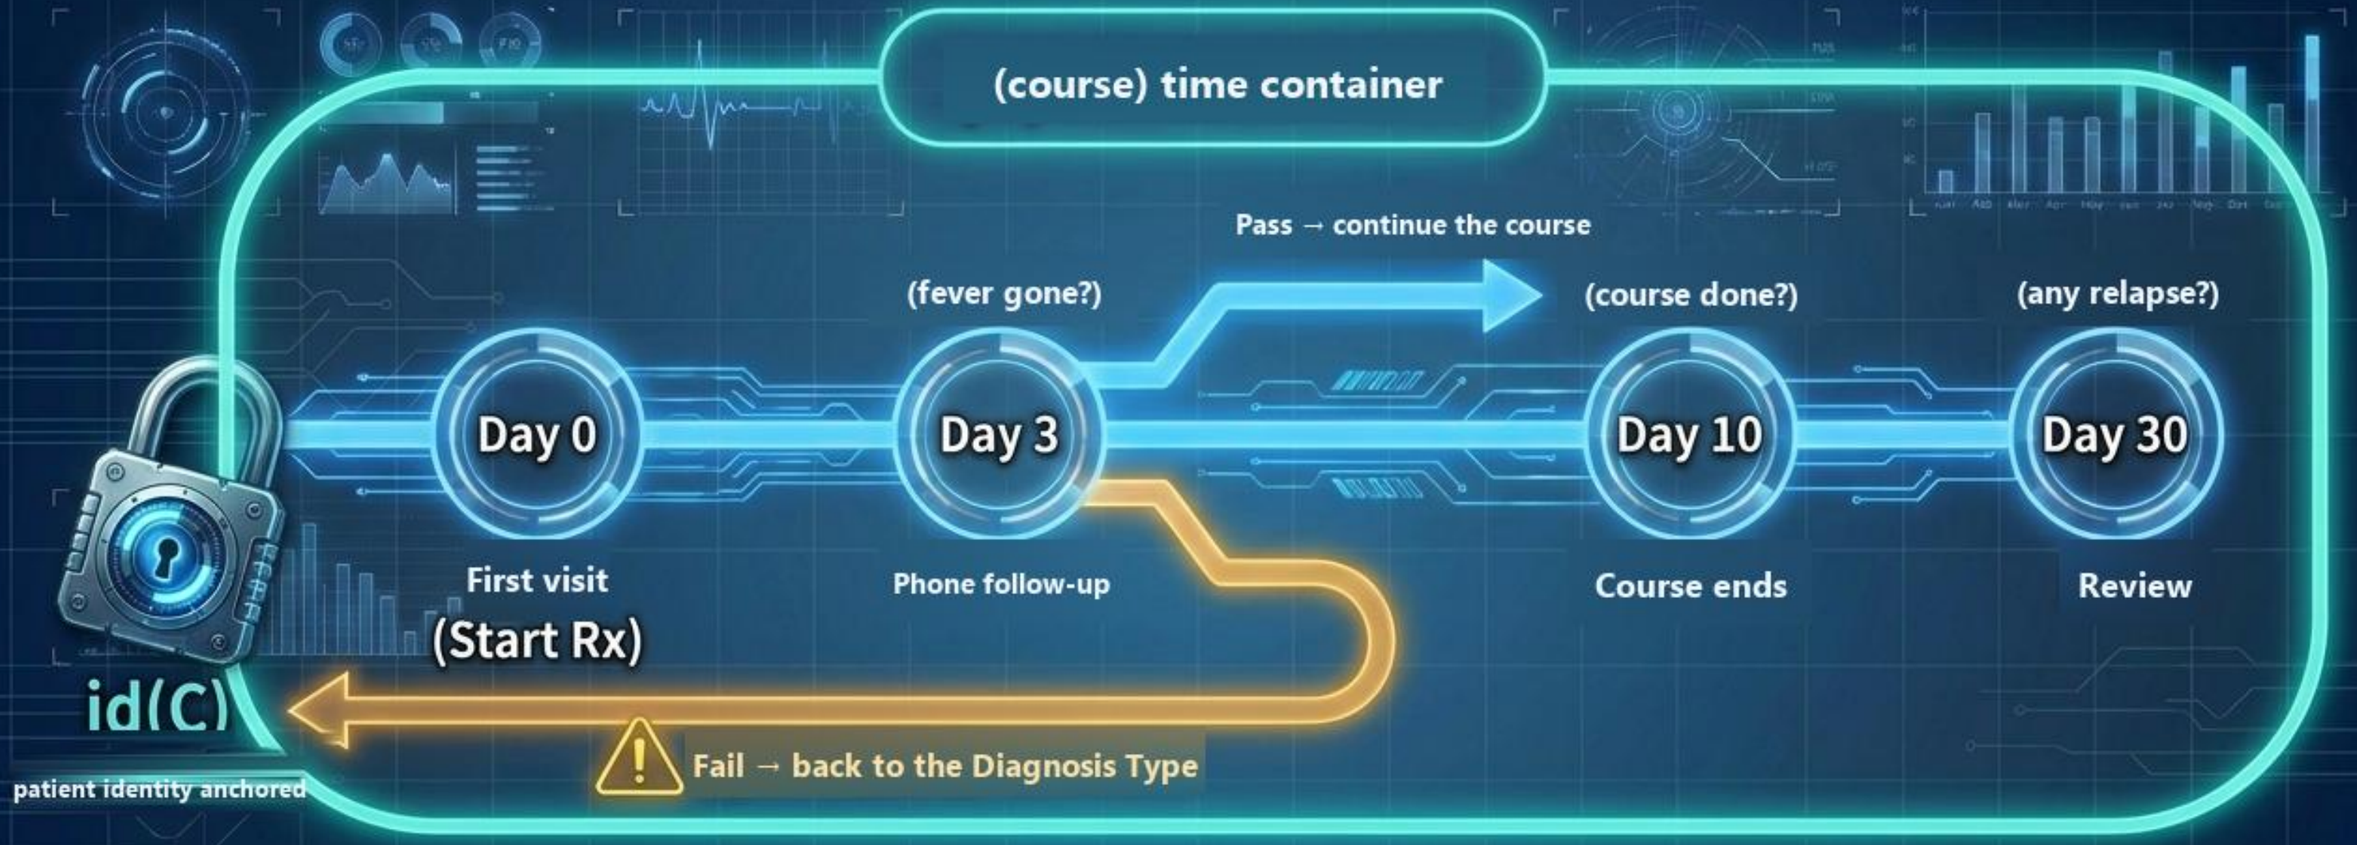

Prescription { }

- **Primary drug (Main Drug):** Penicillin V 500 mg QID × 10 days
  - Course days (Days) — Remove L3: remove the days: the dose semantics collapse, not executable
  - Remove L2: remove the primary drug — treatment fails / function breaks
- **Relief:** Acetaminophen 500 mg PRN
- **Local:** warm saline gargle q4–6h
- **Education:** finish the course, return on red flags
  - Remove L1: remove education — quality suffers

When writing a prescription, the level-three components (primary drug, days) may not be omitted or swapped.

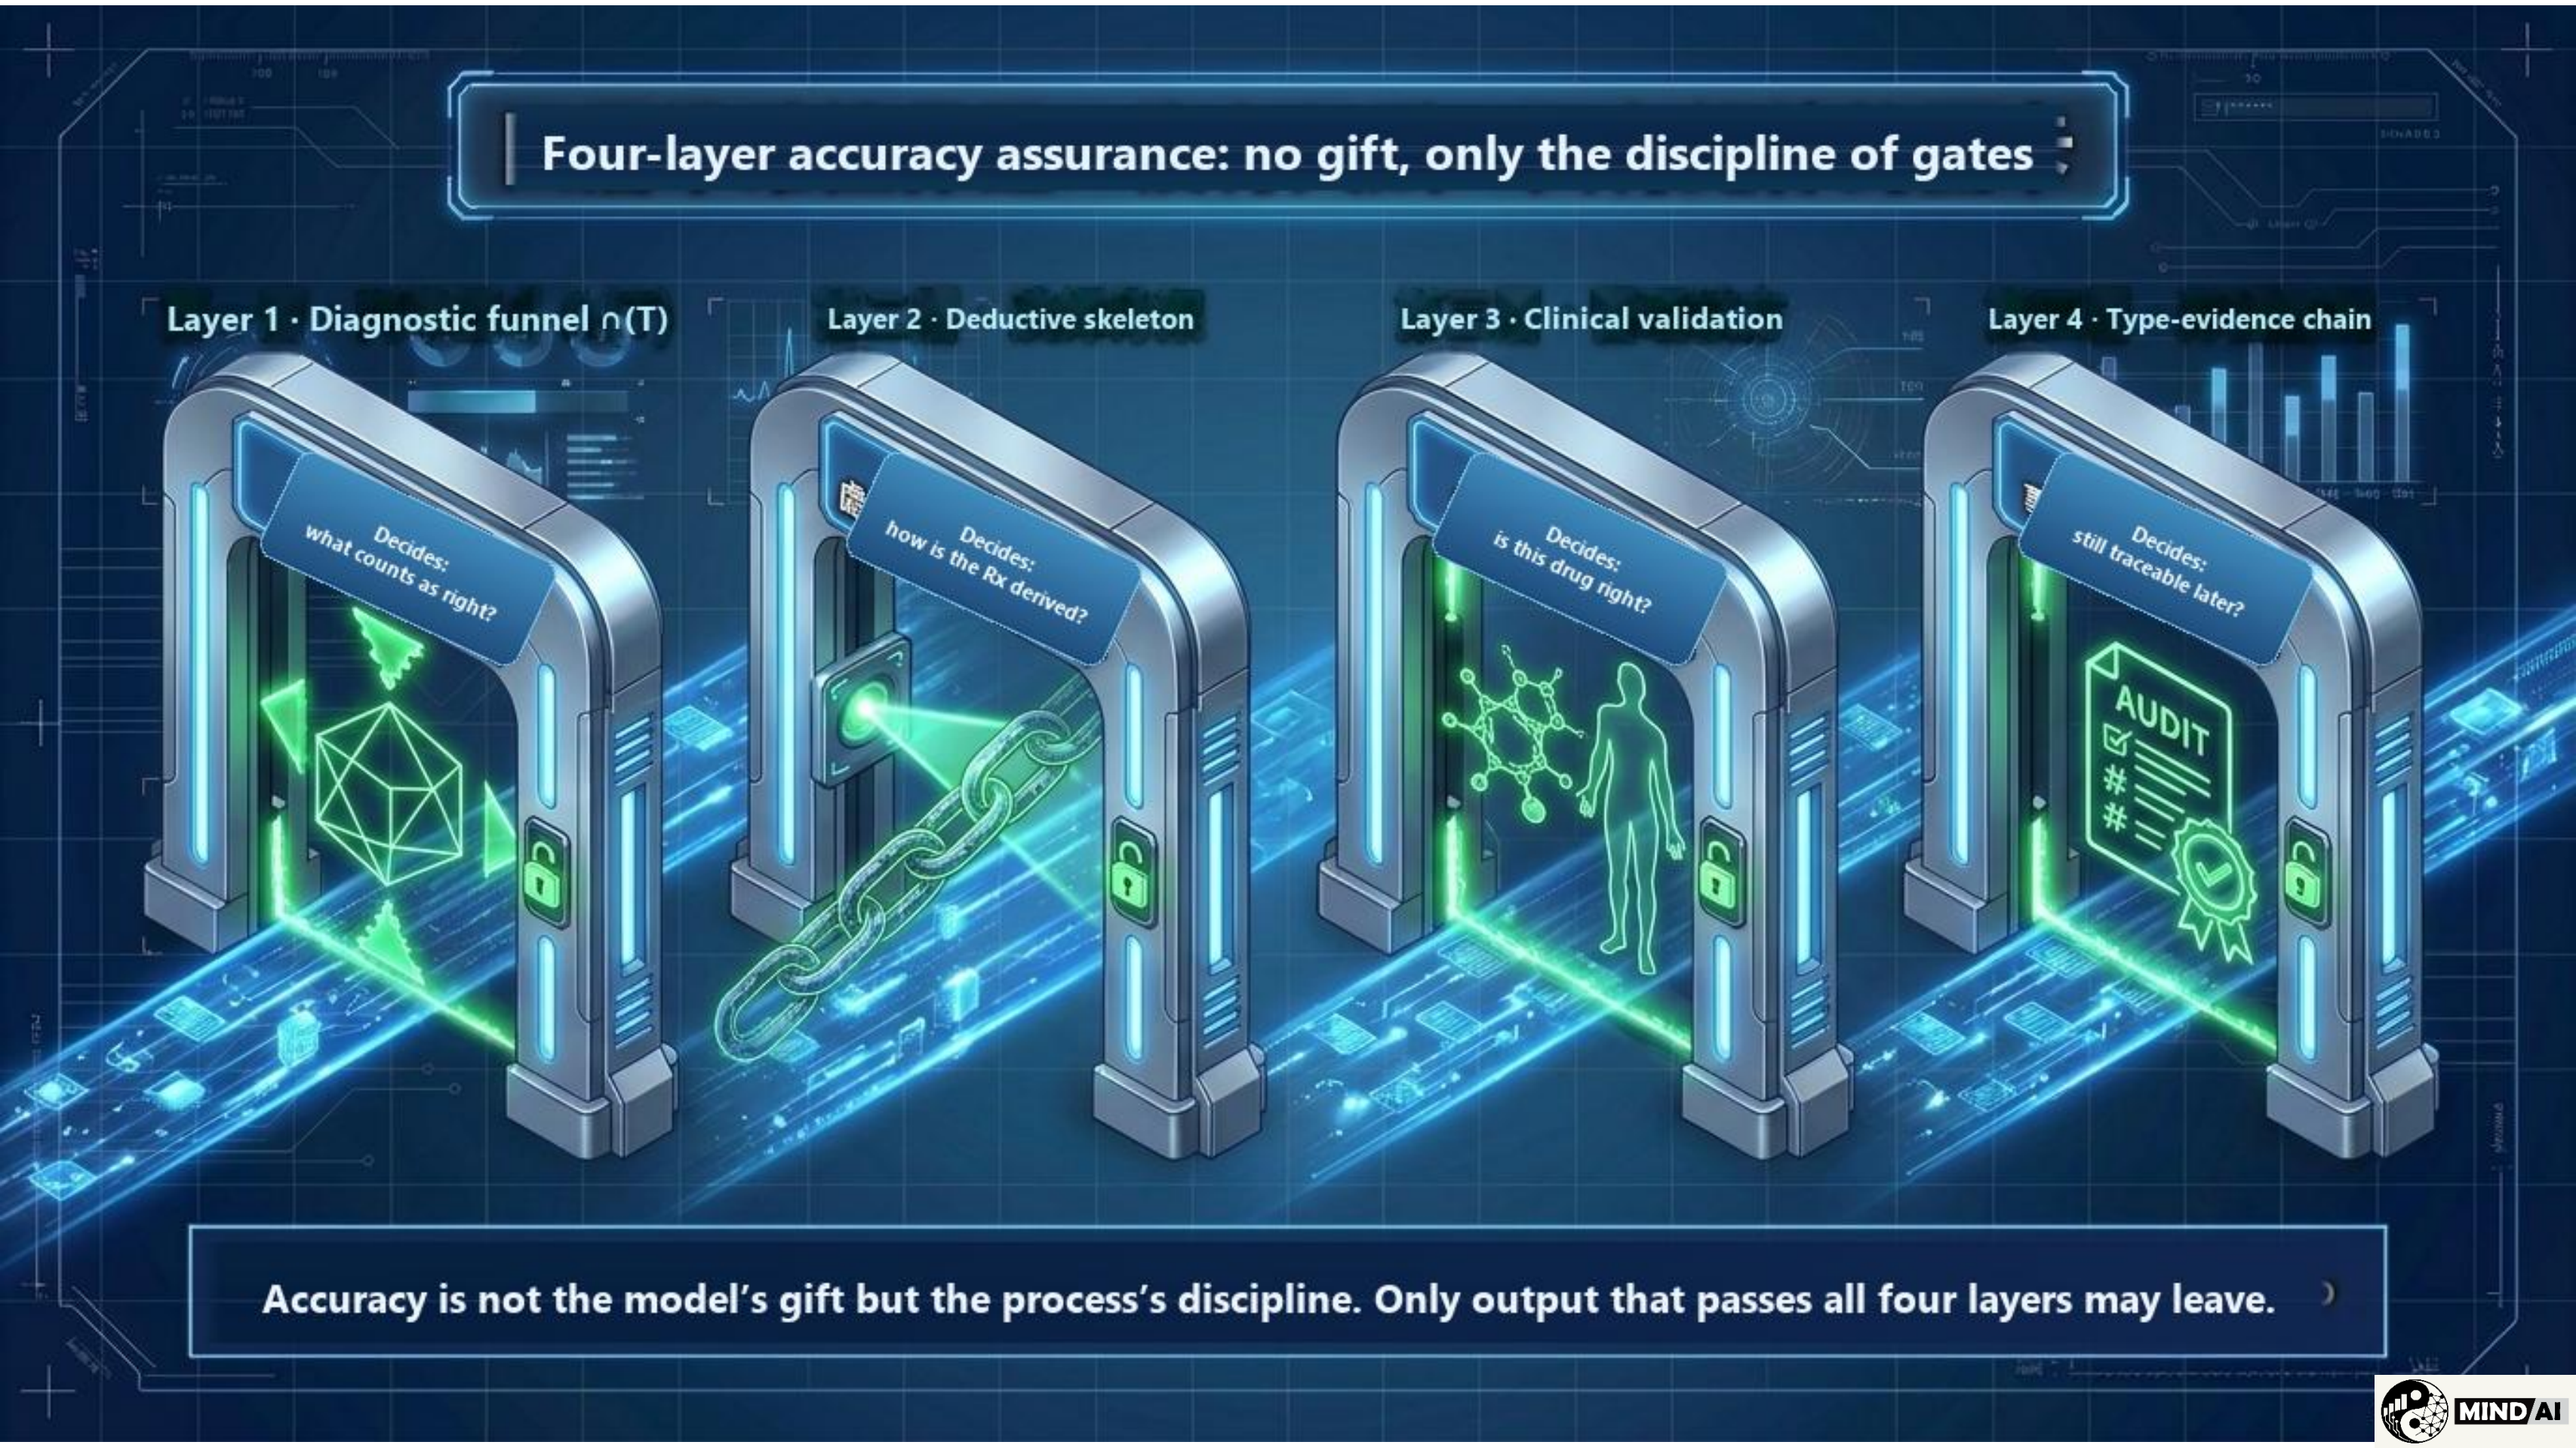

MIND AI

Follow-up Type and the Time Container: A Return Visit Is the Next Page

A return visit is not a restart but a new time slice on the same chain: append the difference, never re-copy the record.

Four-layer accuracy assurance: no gift, only the discipline of gates

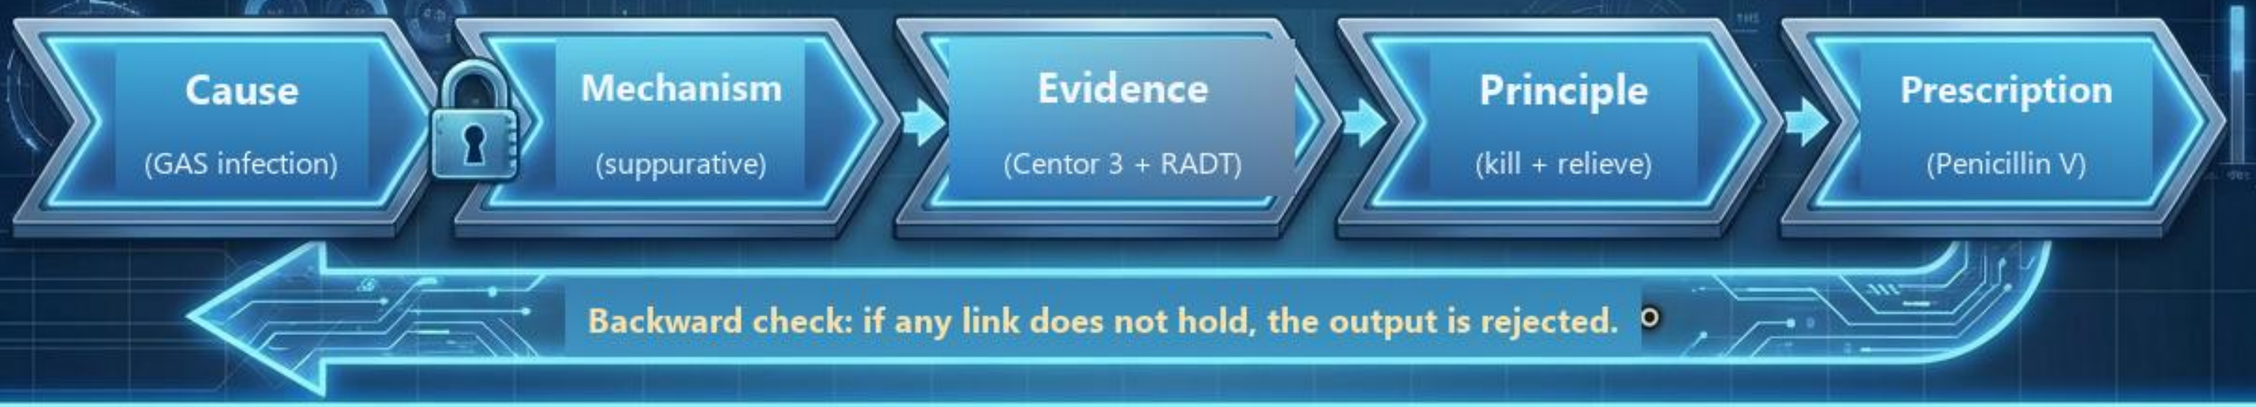

Accuracy is not the model's gift but the process's discipline. Only output that passes all four layers may leave.

MIND AI

Deep Dive: The Deductive Skeleton and the Three Validation Questions

Deductive Skeleton

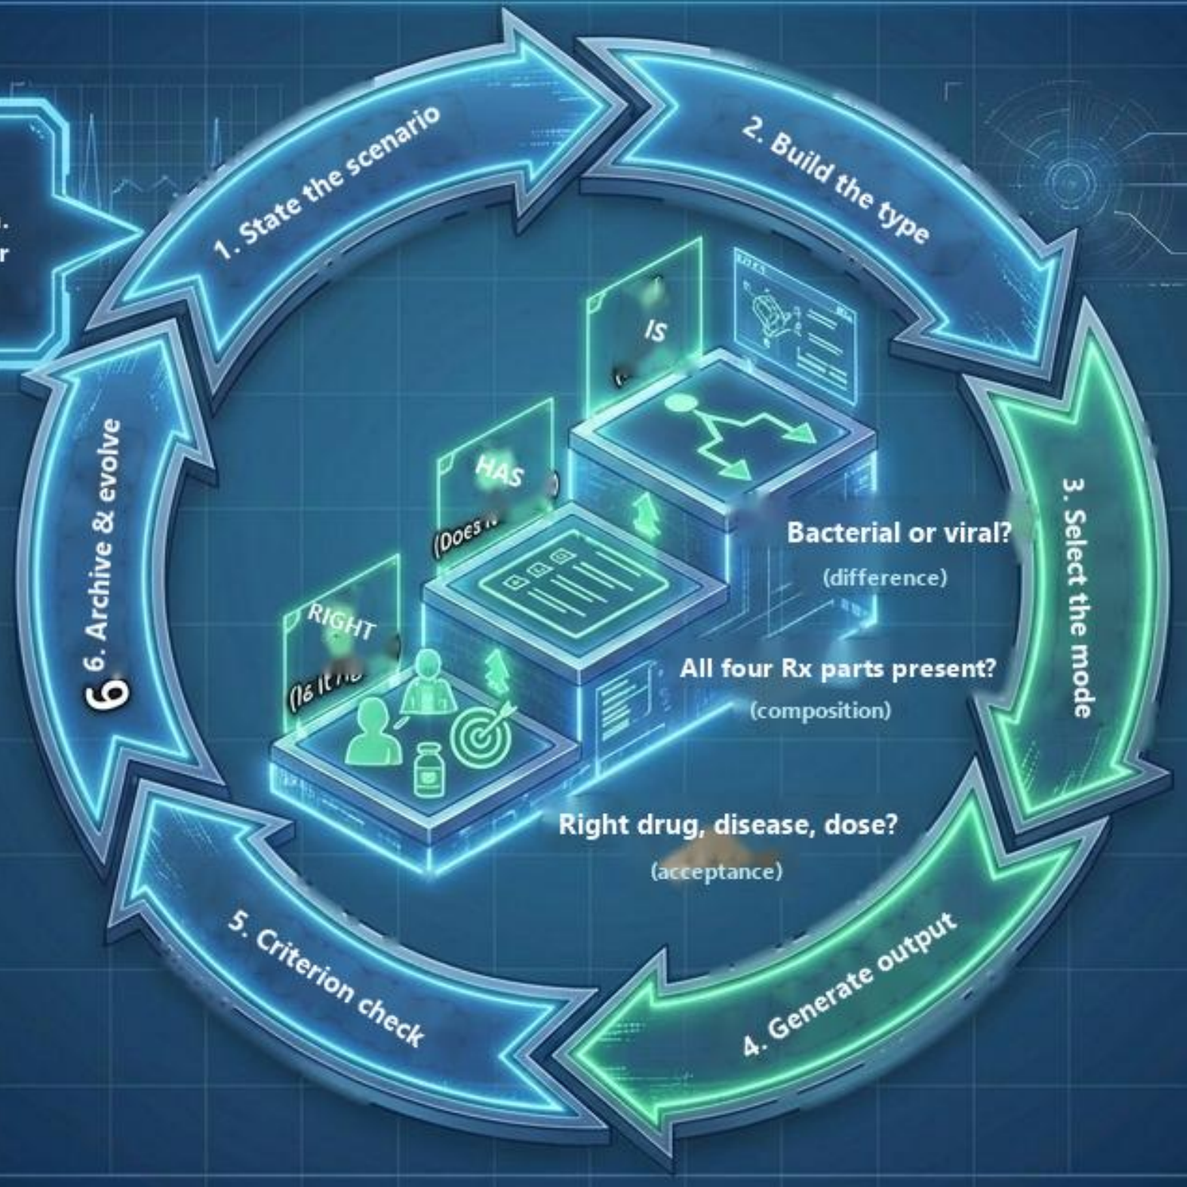

Medical Validation

MIND AI

Six-step engine and the three-layer judgement framework

Four steps: read the context, set the boundary, fix the fields, define the criteria. Fast move for emergencies, long move for chronic disease.

MIND AI

The S1–S7 Prompt Relay: A Fully Controllable Pipeline Design

Any segment can be audited alone and re-run alone. Garbage in, garbage out.

MIND AI

The Type-Evidence Chain: A Space × Time Cross-Acceptance Matrix

Space · Structure

Are all 6 Type fields populated?

Is the BOM divisible?

Space · Semantics

Are the Remove-3-Level tags present?

Is nomenclature consistent?

ACCEPT

Time · Sequence

Did criteria precede data?

Did the skeleton precede the prescription?

Time · Evolution

Is the clinical adjustment justified?

Is the identity container unbroken?

Time

Space

Inputs sourced, process evidenced, output auditable, timeline replayable. Any segment can be audited alone and re-run alone.

MIND AI

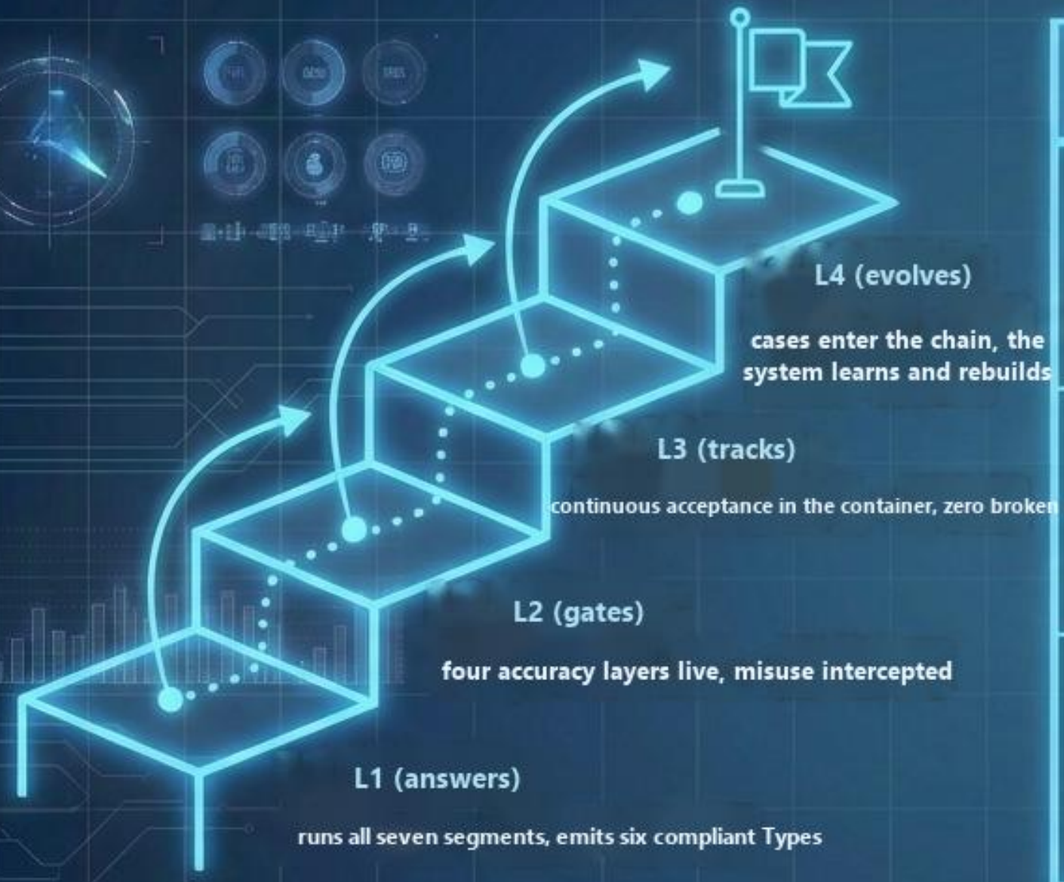

Governance and Error Prevention: Five Common Misuses and System-Level Defences

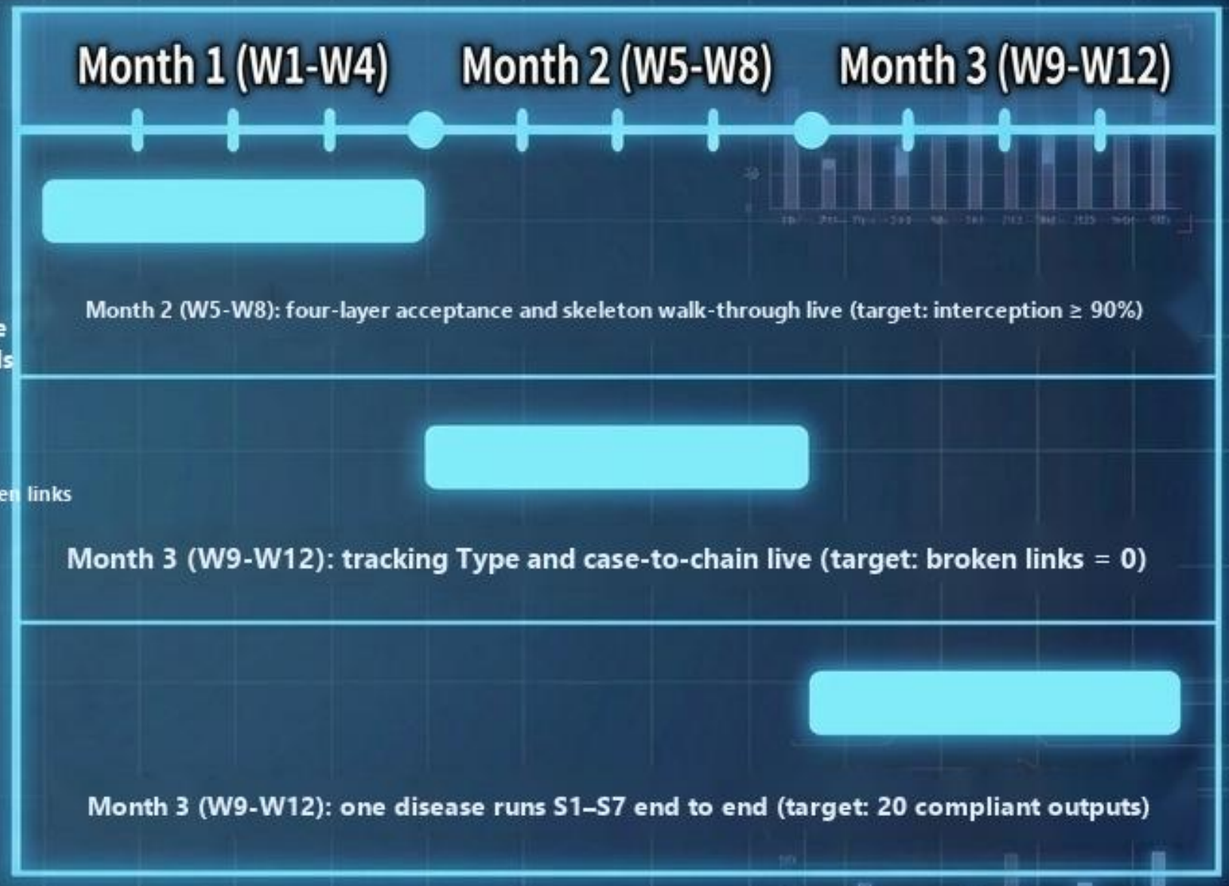

Common misuse (Failure)	System constraint
Using the LLM as the doctor (Jumping to answers)	Force all seven S1–S7 segments to run
Criteria patched in afterwards (Faking criteria post-hoc)	∩(T) first; check the timestamp order
Prescription by lookup table (Generic prescribing)	Deductive skeleton walked backwards (Must match pathology)
Skipping validation (Skipping safety checks)	The three S6 questions are mandatory; a block needs a fallback
Broken follow-up chain (Fragmented histories)	Next page in the container, anchored to id(C)

The cure is not “be more careful” but writing the gates into the process.

MIND AI

Maturity ladder and the three-month rollout blueprint

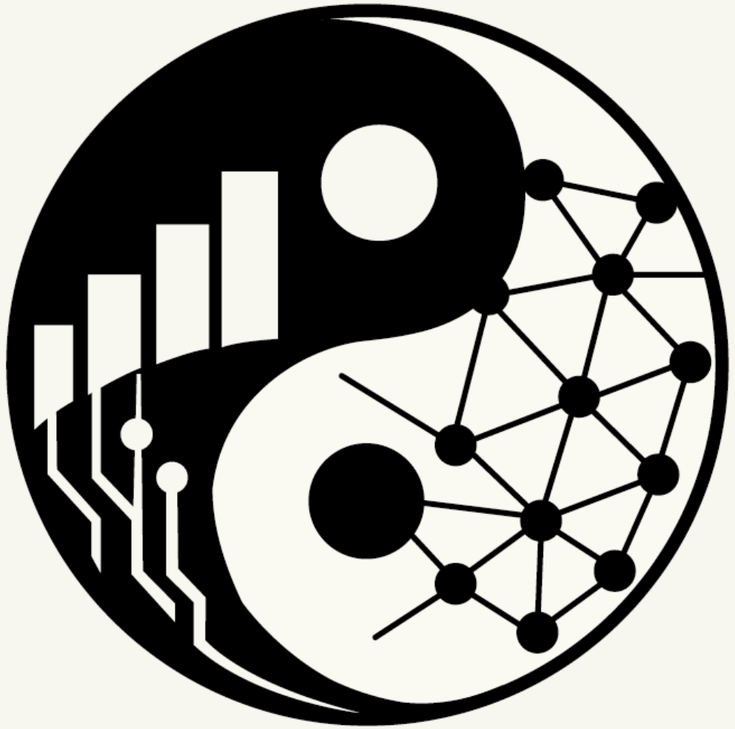

AI is a gatekeeping tool, not the prescribing subject. Prescribing authority and responsibility stay with a qualified physician.

MIND AI

LonGreat Vision: to create intelligent life that understands the essence of the world

MIND AI

"We aim to make artificial intelligence not merely a tool, but a system of intelligent life that truly possesses the abilities to understand, reason, learn, and create."

From the unification of knowledge, to the unification of thought, and finally toward the unification of intelligence – this is the eternal path to AGI that LonGreat pursues.
