Ontypology

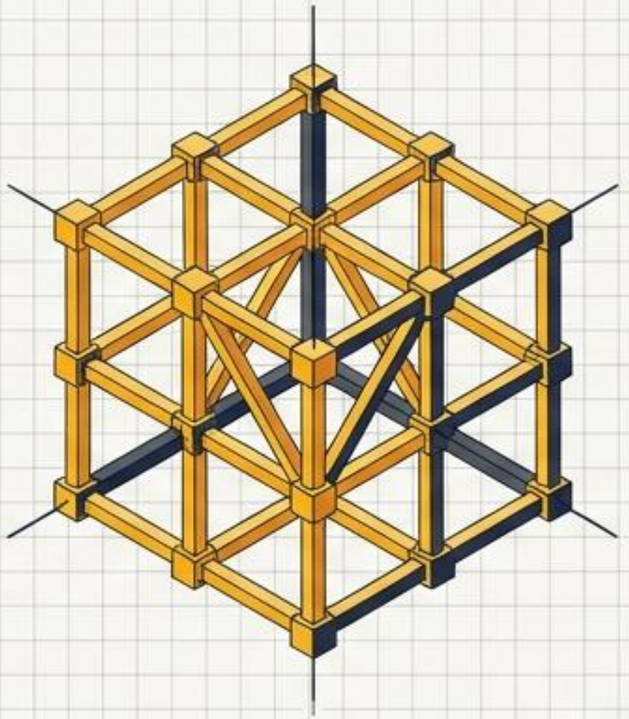

- From difference to division, from division to type, from type to understanding – the brain has walked this path for aeons.
- A century ago, logic was philosophy; once seen clearly, it became an established science.
- Today we explore "Type" (a brain concept) as philosophy; Ontypology makes "Type" clear, turns it into an established science, and puts it into practice as Mind AI.

LLM (language interface)

Compress statistics, and reach
the ultimate of language.

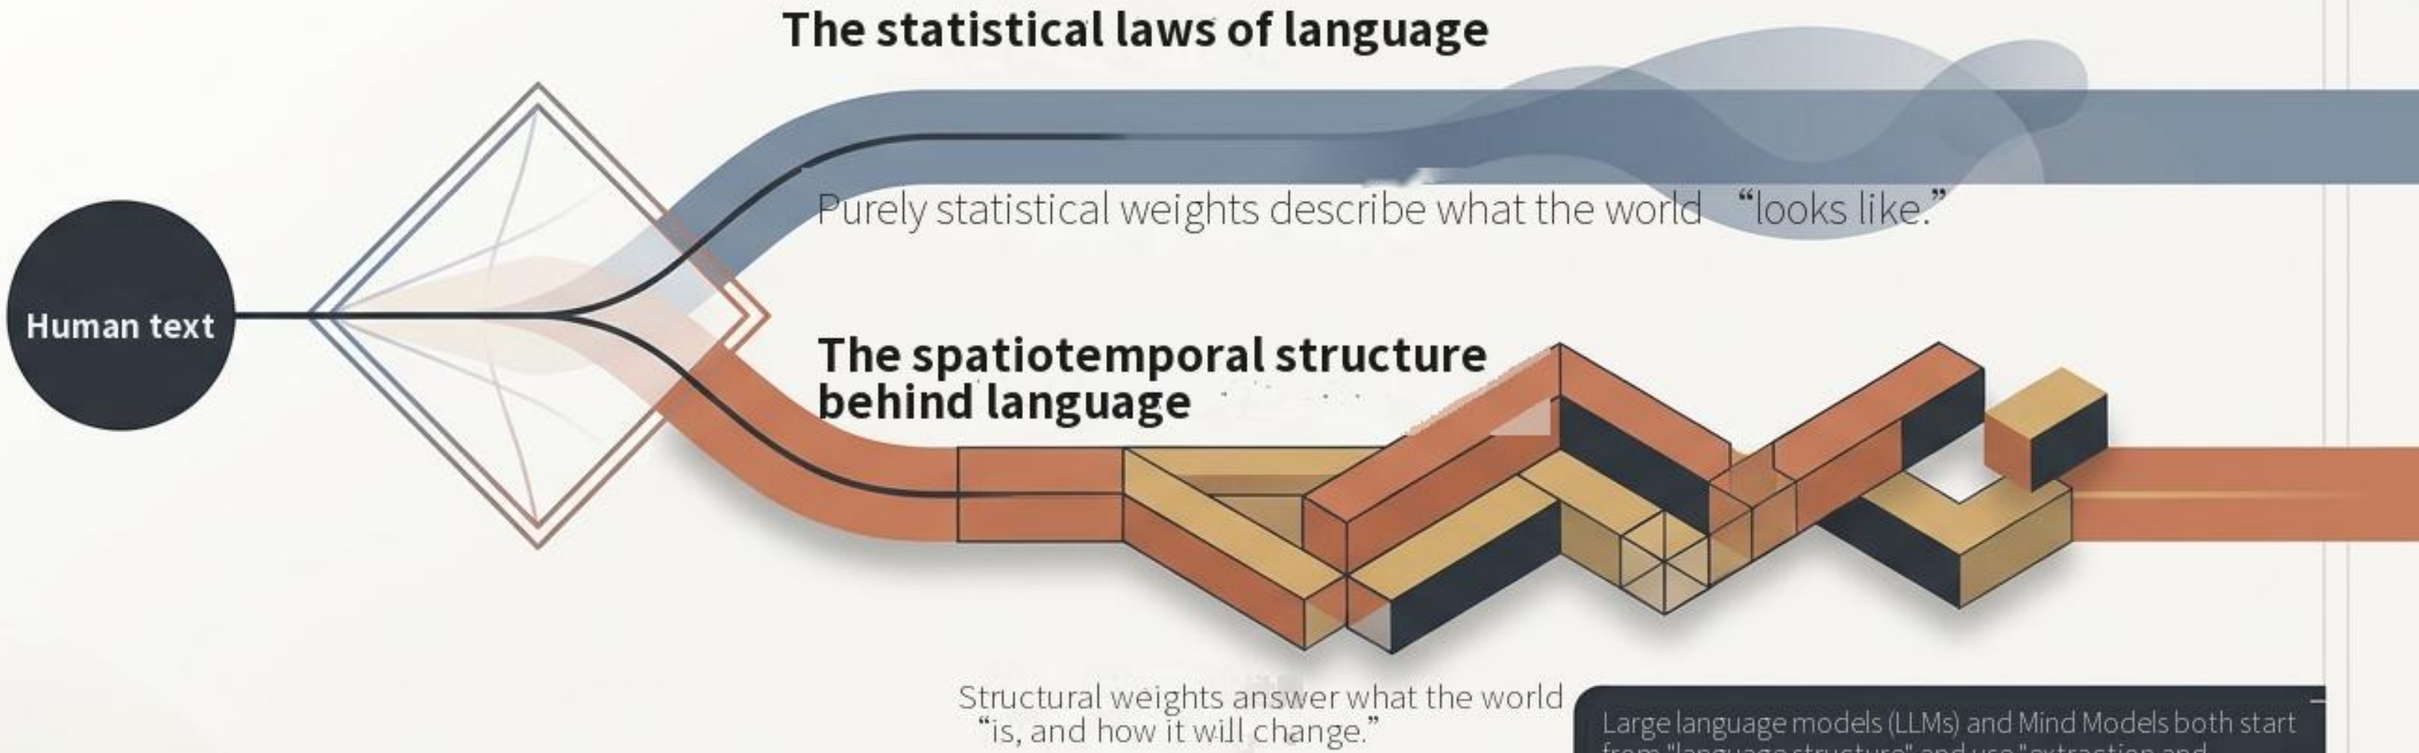

Mind Model (knowledge backbone of spacetime)

Compress spatiotemporal structure,
and reach the backbone of the world.

MIND AI

One path of cognitive compression, two radically different ways

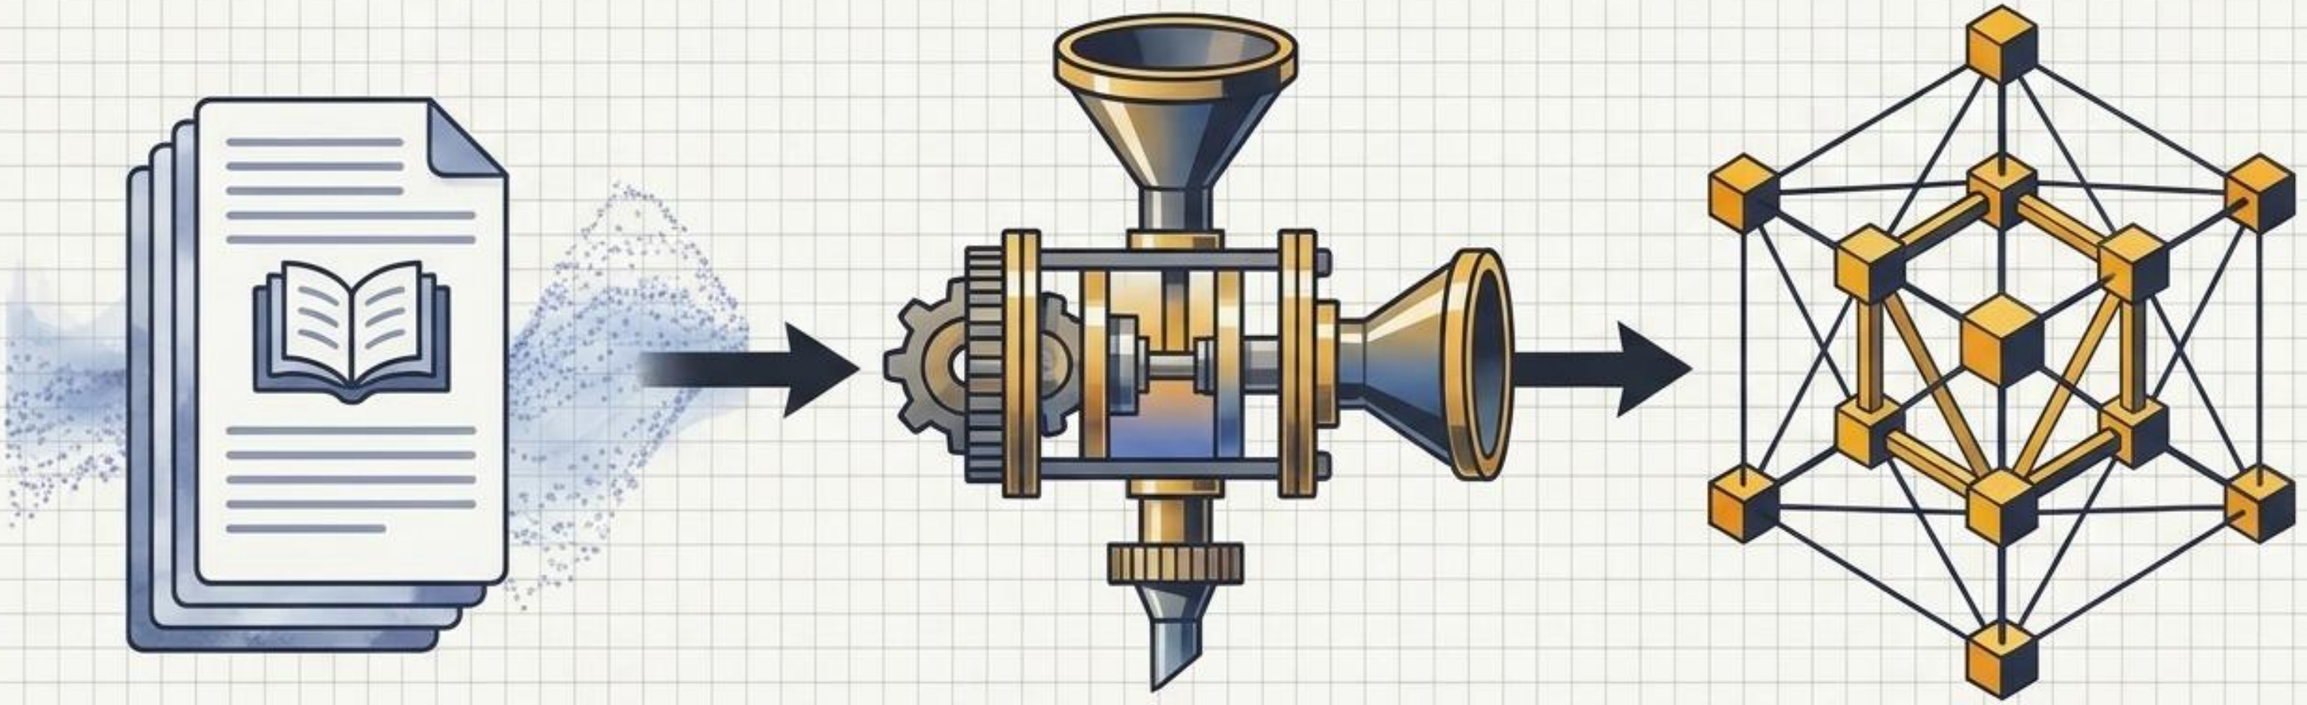

Large language models (LLMs) and Mind Models both start from "language structure" and use "extraction and compression" as their method. The real divergence is in what each compresses into weights. World models and physical AI must write the world as a structure that can be reasoned about.

MIND AI

Massive corpora (language structure)

Extraction and compression

Relational weights

The public interface of human civilization

Knowledge is condensed into Tokens and the relations between Tokens

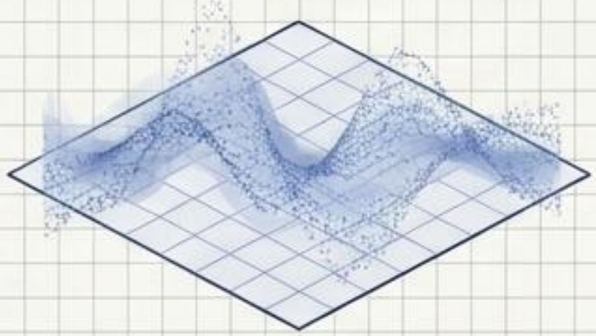

The same starting point, the same method of digestion.
Whether brain or machine, the essence of learning is extraction and compression.

MIND AI

The fork: what gets compressed into the weights — the statistical laws of language, or the spatiotemporal structure behind it?

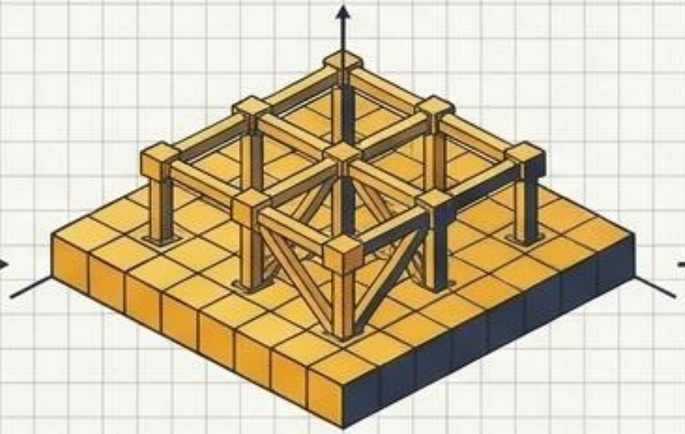

Relational weights

Compress statistical laws

- Co-occurrence
- Distribution
- Context

Compress spatiotemporal structure

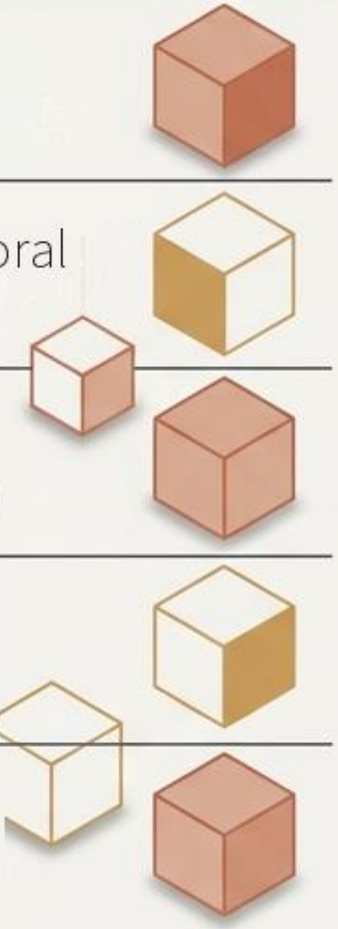

- Composition
- Identity
- Features
- Temporal order

MIND AI

At a glance: five decisive forks between the two paradigms

Aspect	LLM (the ultimate of the language plane)	Mind Model (the spatiotemporal backbone)
Compressed content	**The statistical laws of language** (co-occurrence, distribution, context)	**The spatiotemporal structure behind language** (composition, identity, features, temporal order)
Form of relations	Token ↔ Token planar relations	Token ↔ Token spatiotemporal structural relations
Shape of knowledge	**Distributed weights** (implicitly emergent, hard to trace to evidence)	**Explicit structure of Types** (identifiable, nameable, verifiable)
Mode of reasoning	**Probabilistic generation** (predict the next Token)	**Structural judgment** (recognition, classification and computation of Types)
Learning updates	**Training and fine-tuning** (batch updates, at high cost)	**Augmentation and restructuring** (Types can evolve step by step, incrementally)

MIND AI

LLM's historical position: the ultimate of the language plane

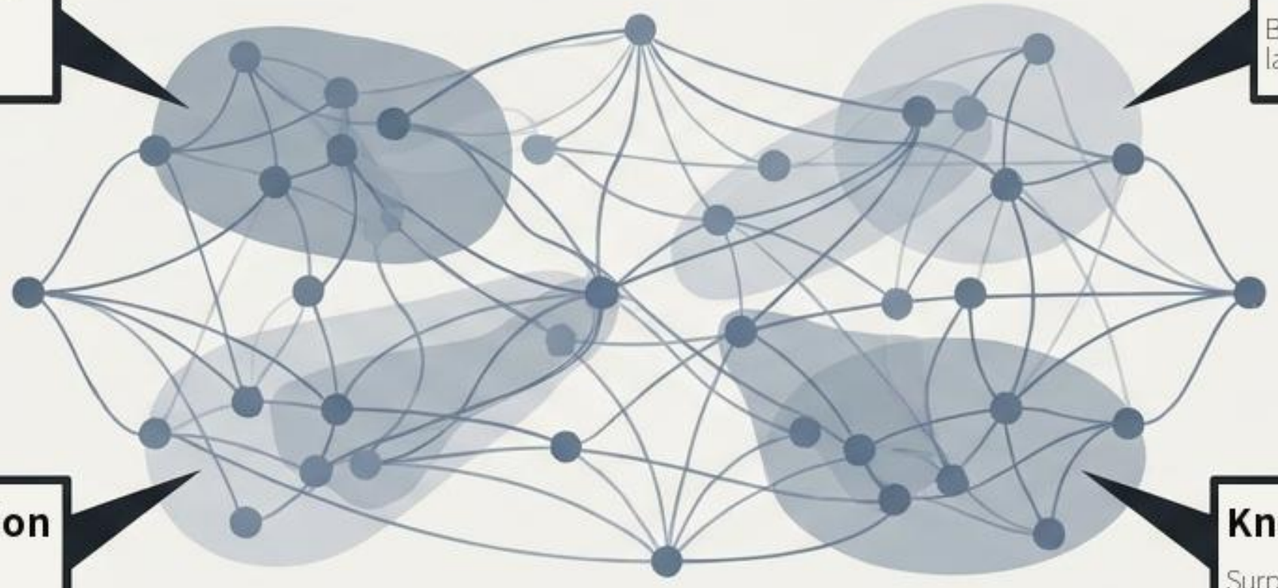

LLM perfects "extraction and compression" on the language plane, becoming everyone's first window onto AI. It is the ultimate "interface", not the whole of intelligence.

Language understanding and generation

Fluent, effortless expression.

Cross-lingual transfer

Breaking down human language barriers.

Contextual generalization

Powerful contextual capture and adaptation.

Knowledge recall and creativity

Surprise and association from distributed probabilities.

MIND AI

The Mind Model's position: the backbone of the spatiotemporal plane

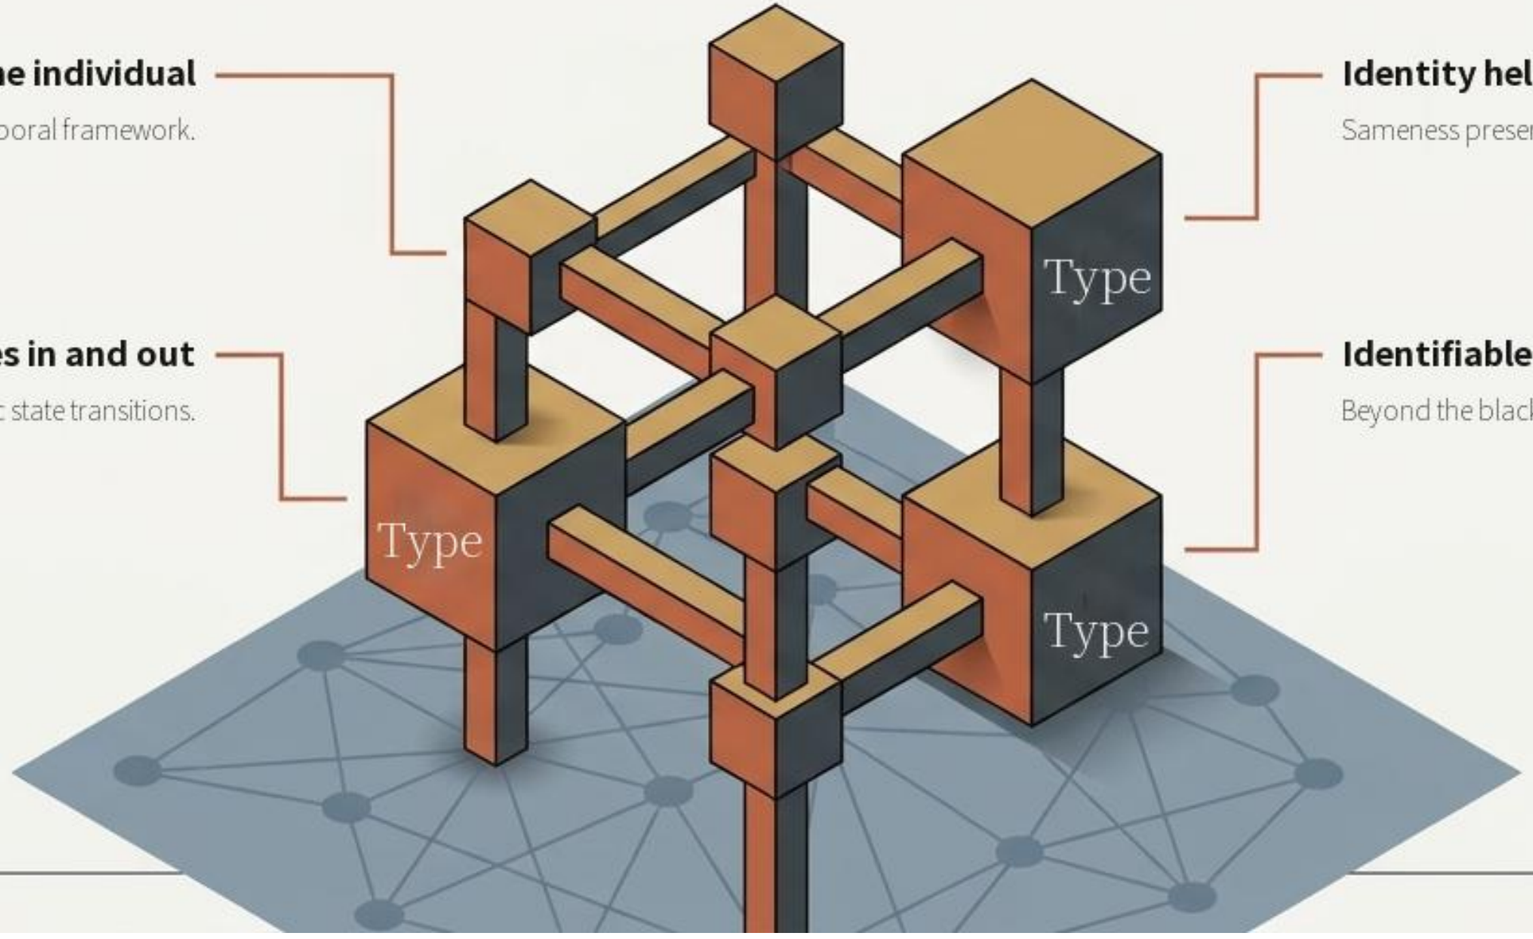

Push "extraction and compression" one layer deeper into the spatiotemporal plane: its product is not a "model that talks better", but a knowledge backbone that can be "inspected, taught and evolved". For the first time, knowledge has an address.

Structure before the individual

A rigorous spatiotemporal framework.

Temporal order: Types in and out

It supports dynamic state transitions.

Identity held constant

Sameness preserved through complex derivation.

Identifiable and verifiable

Beyond the black box: verifiable structural logic.

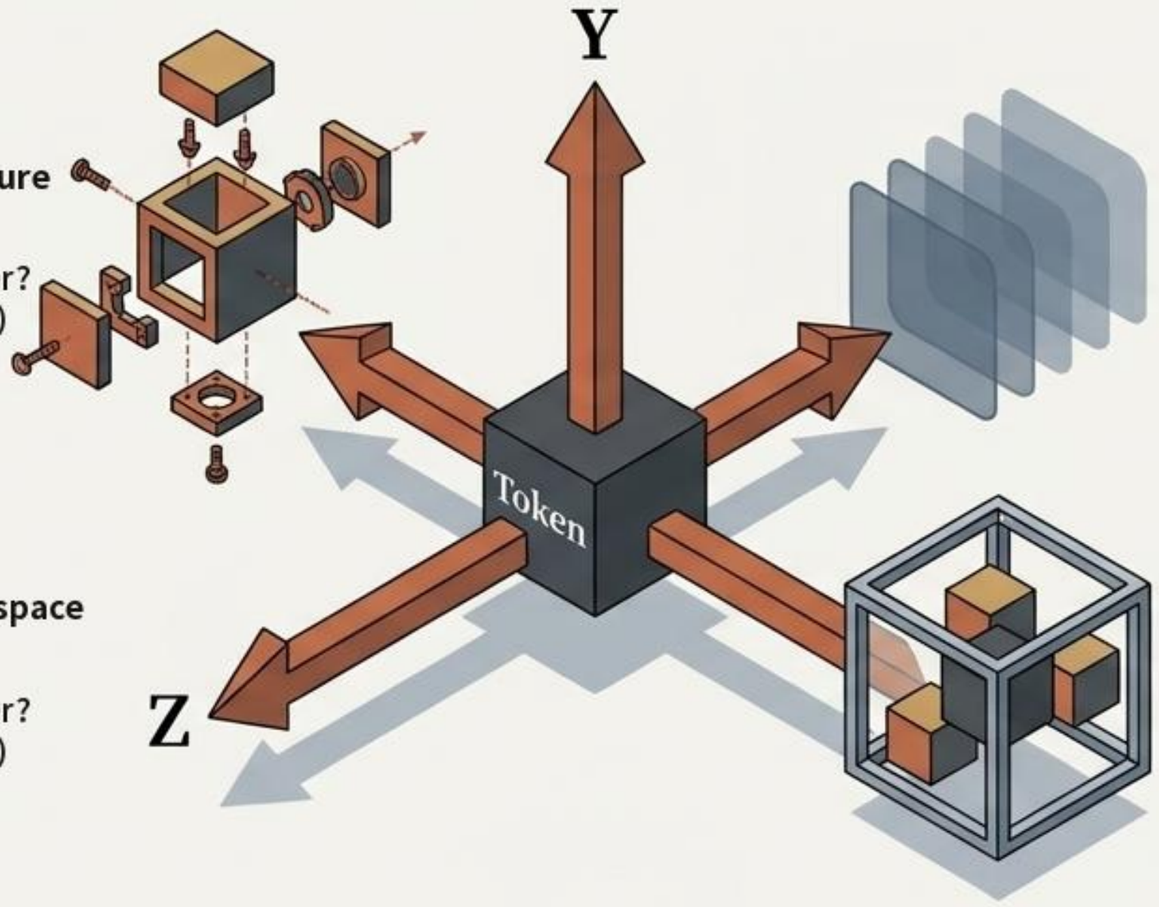

MIND AI

Upgrading to "Type": three relational coordinates of spatiotemporal structure

Upgrade a Token from "a position in the sequence" to a Type that "can be located, disassembled, classified and traced".

{BOM} Composition and structure

Which parts compose it, and how do the parts depend on each other?
(disassembly / assembly coordinate)

[Abstraction] Similarity and features

Which Types does this Type resemble? What features does it have?
(classification / recognition coordinate)

{Disassembly} Composition and space

Which parts compose it, and how do the parts depend on each other?
(disassembly / assembly coordinate)

(Container) Identity and space

What is its identity? Inside whom is it located?
(sameness / persistence coordinate)

MIND AI

After compression: two textures of weights

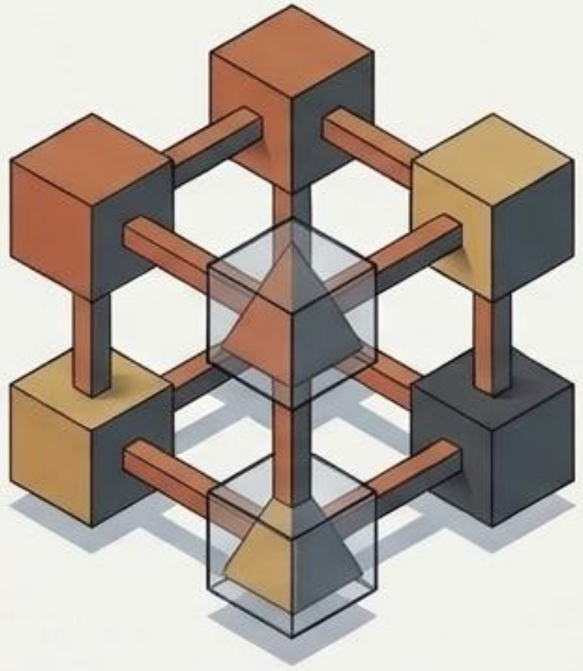

The distributed cloud (LLM)

It only answers: "How alike are they?"

Traits: implicit emergence, holistic operation. The answer can be stated, but its source and case path are hard to trace precisely.

The structured Type network (Mind Model)

It answers: "How are they composed, classified, dependent, evolved?"

Traits: explicit structure. Every node and link can be identified, named, and reviewed one by one.

MIND AI

LLM capability boundary: the gap appears where spatiotemporal structure is absent

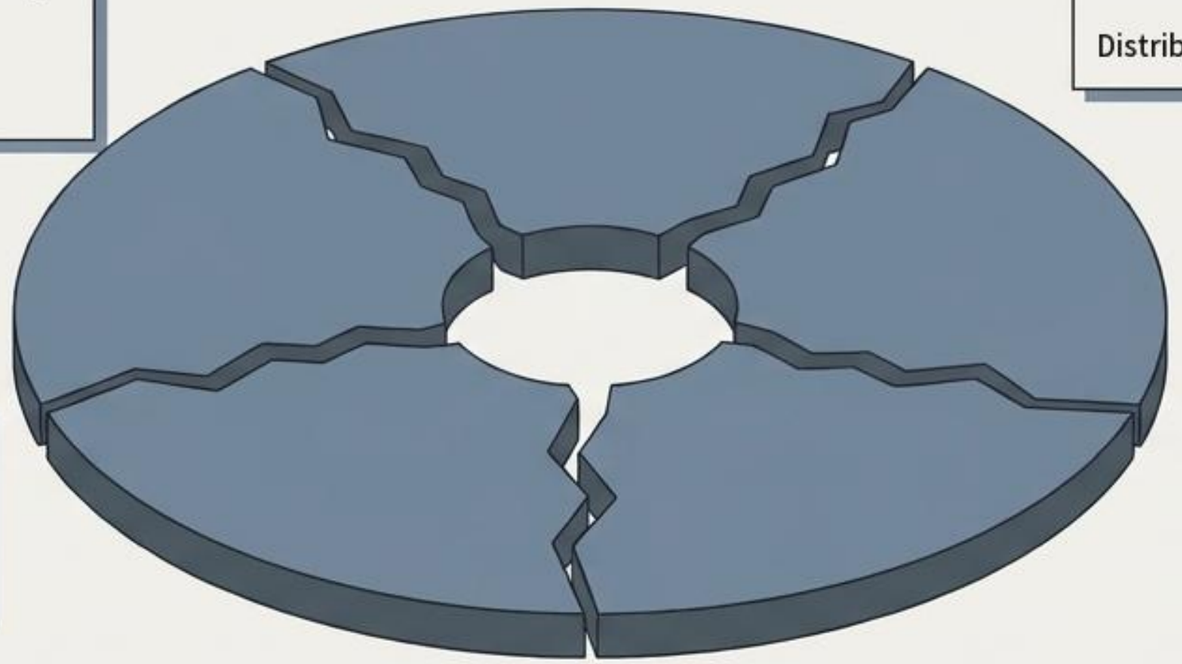

Its boundary is not a failure but a position: when a task requires "understanding the physical world", not just "expression", the limit of the pure language plane surfaces.

Similarity ≠ understanding

Knowing "what it is like"
is not knowing "what it is".

Hallucination, no traceable basis

Distributed weights hide the source.

Knowledge resists unification

Knowledge from different domains
cannot be reasoned across.

No persistent identity or memory

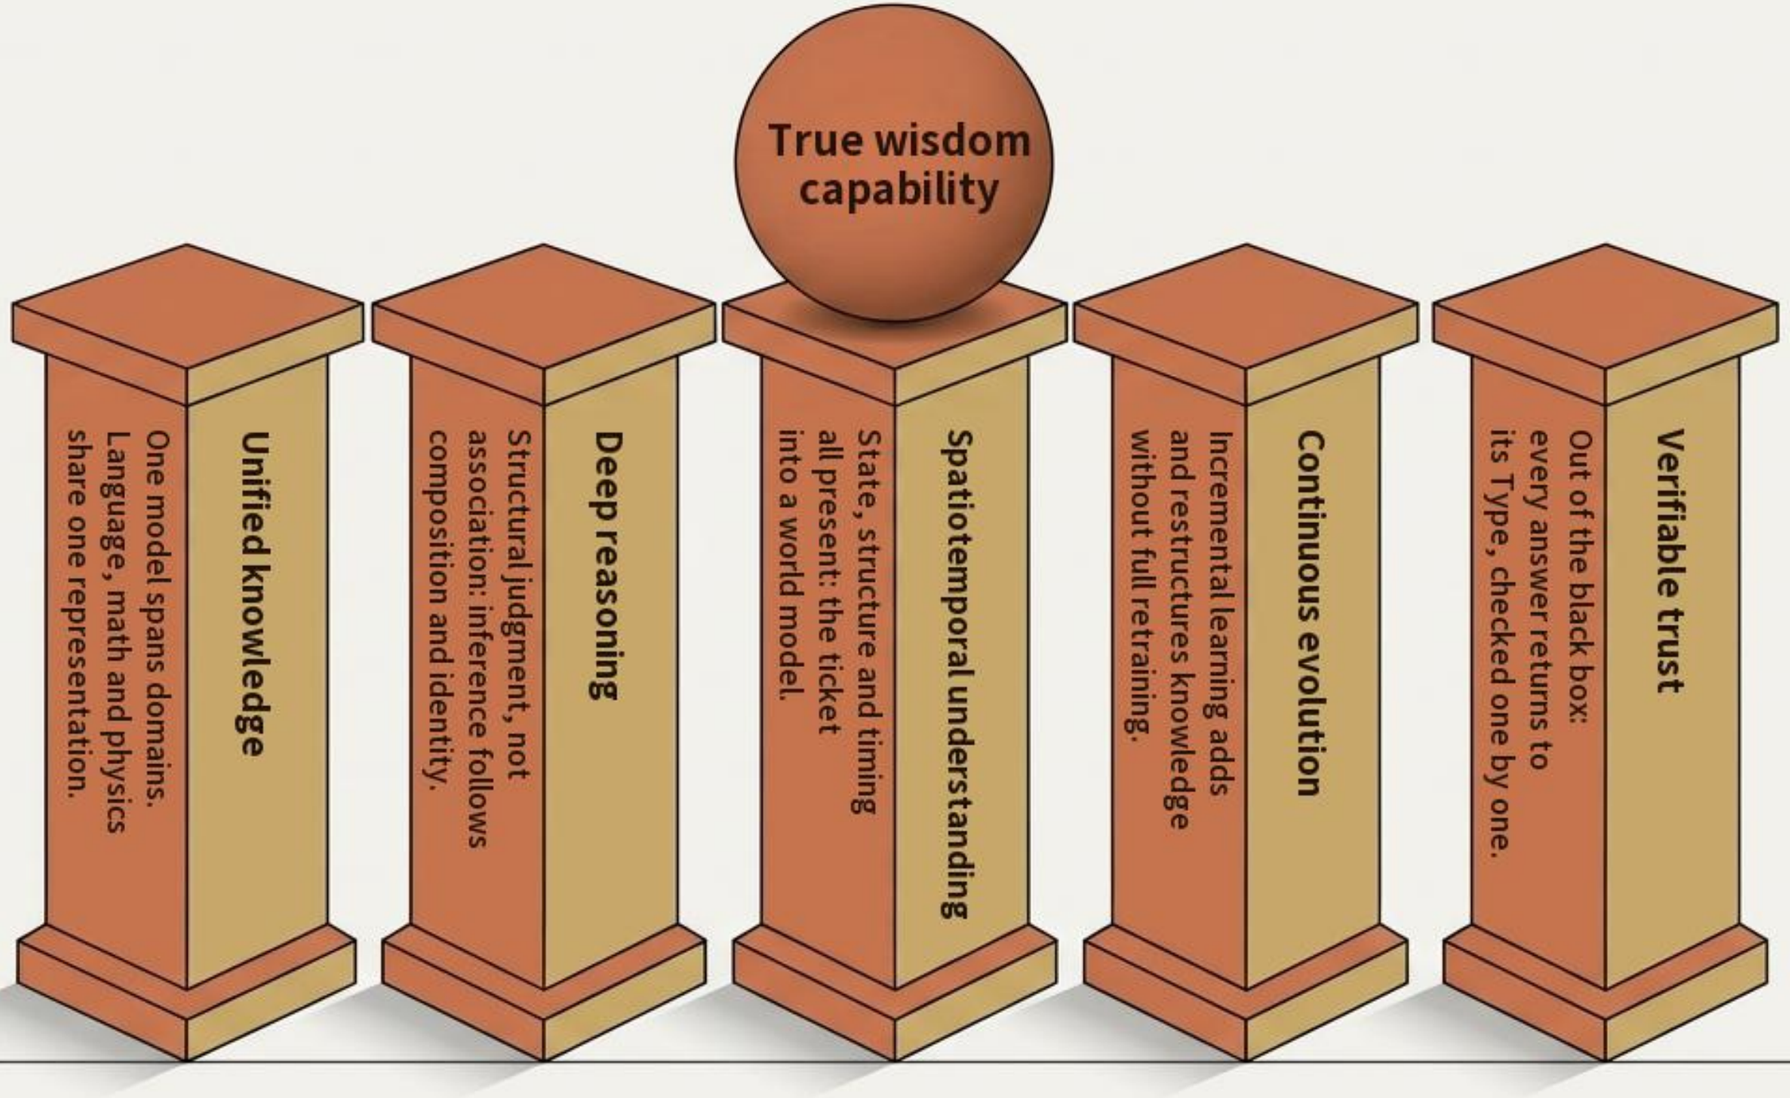

A constant identity is hard to keep
across conversations.

The cost of updating is high

Injecting new knowledge often needs
retraining the whole batch.

MIND AI

Five pillars of understanding: from language to wisdom

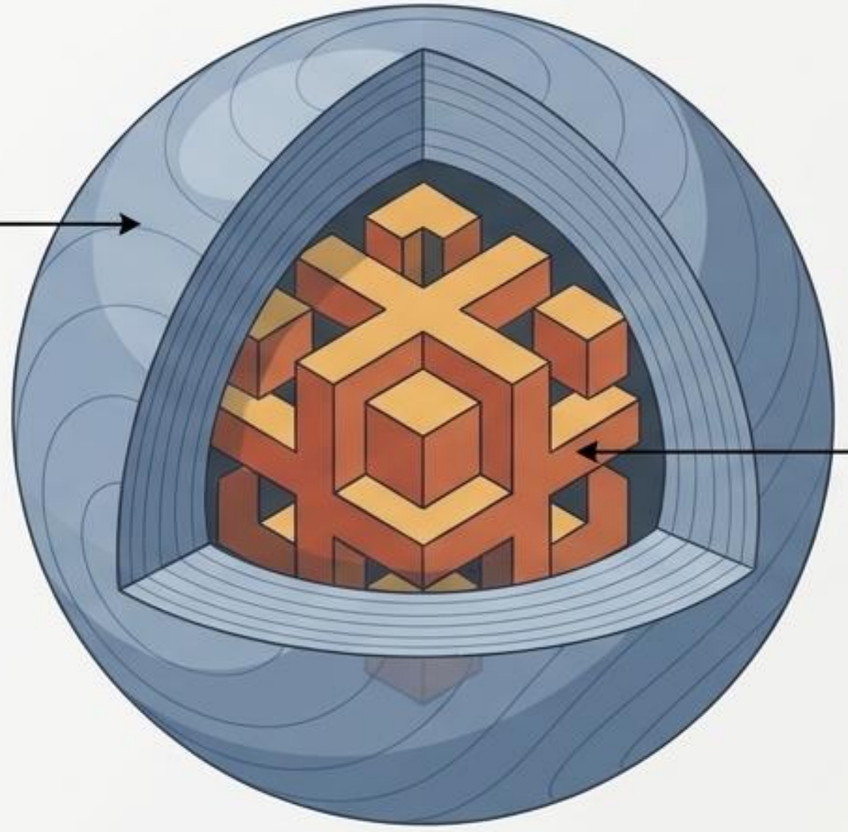

Complementary, not a substitute: a complete system of wisdom

LLM and Mind Model are not either-or. Together they form the complete architecture on the road to AGI.

Language ability (communication) × wisdom ability (understanding) = a complete system

Language interface: LLM

It listens, speaks, reads and writes. The most fluid human-machine interface: it takes intent in and puts thought out.

Knowledge backbone: Mind Model

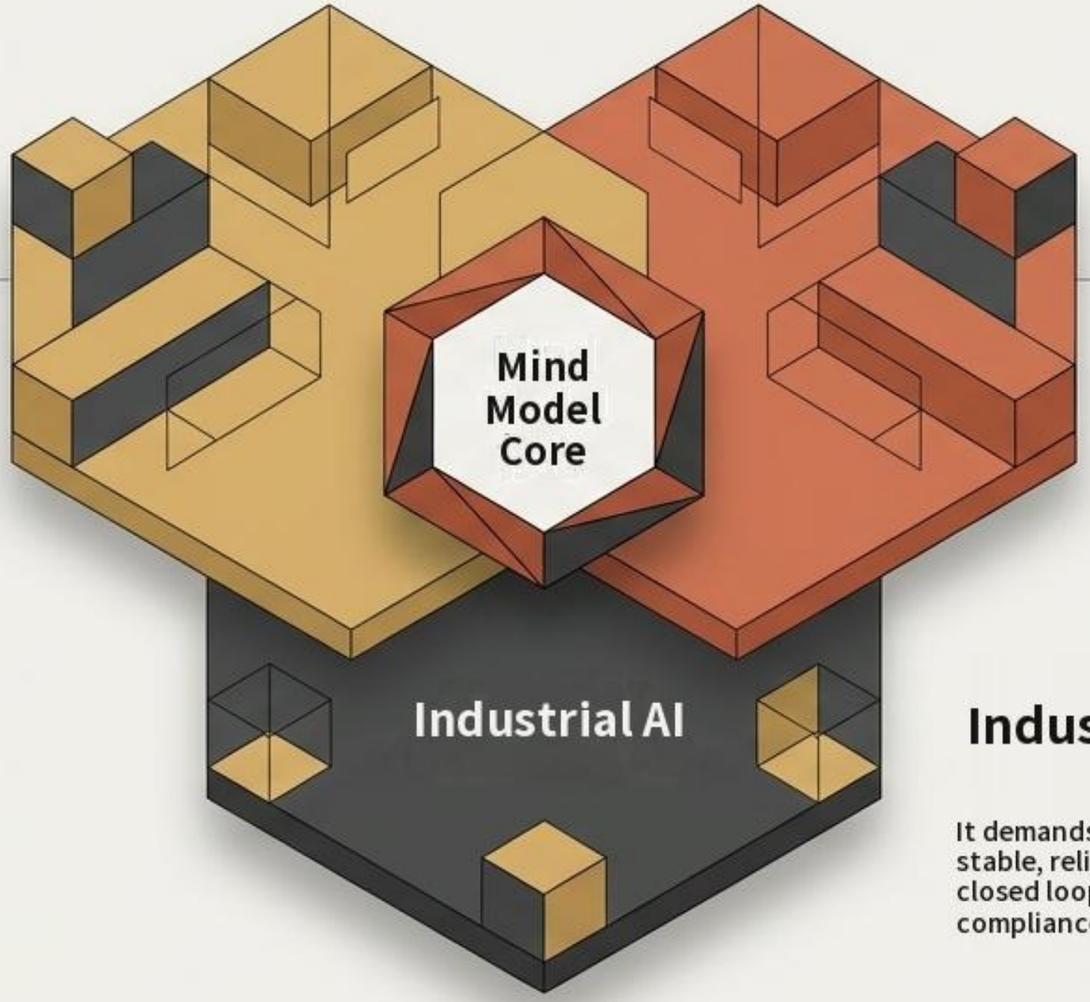

It handles understanding, reasoning, memory and learning. The solid world behind the interface, upholding the correctness of every interaction.

MIND AI

Physical AI: spacetime structure as the inevitable destination

World Models

It must answer the world's state right now, how it will transition, the causality behind it, and predict the future.

Physical AI

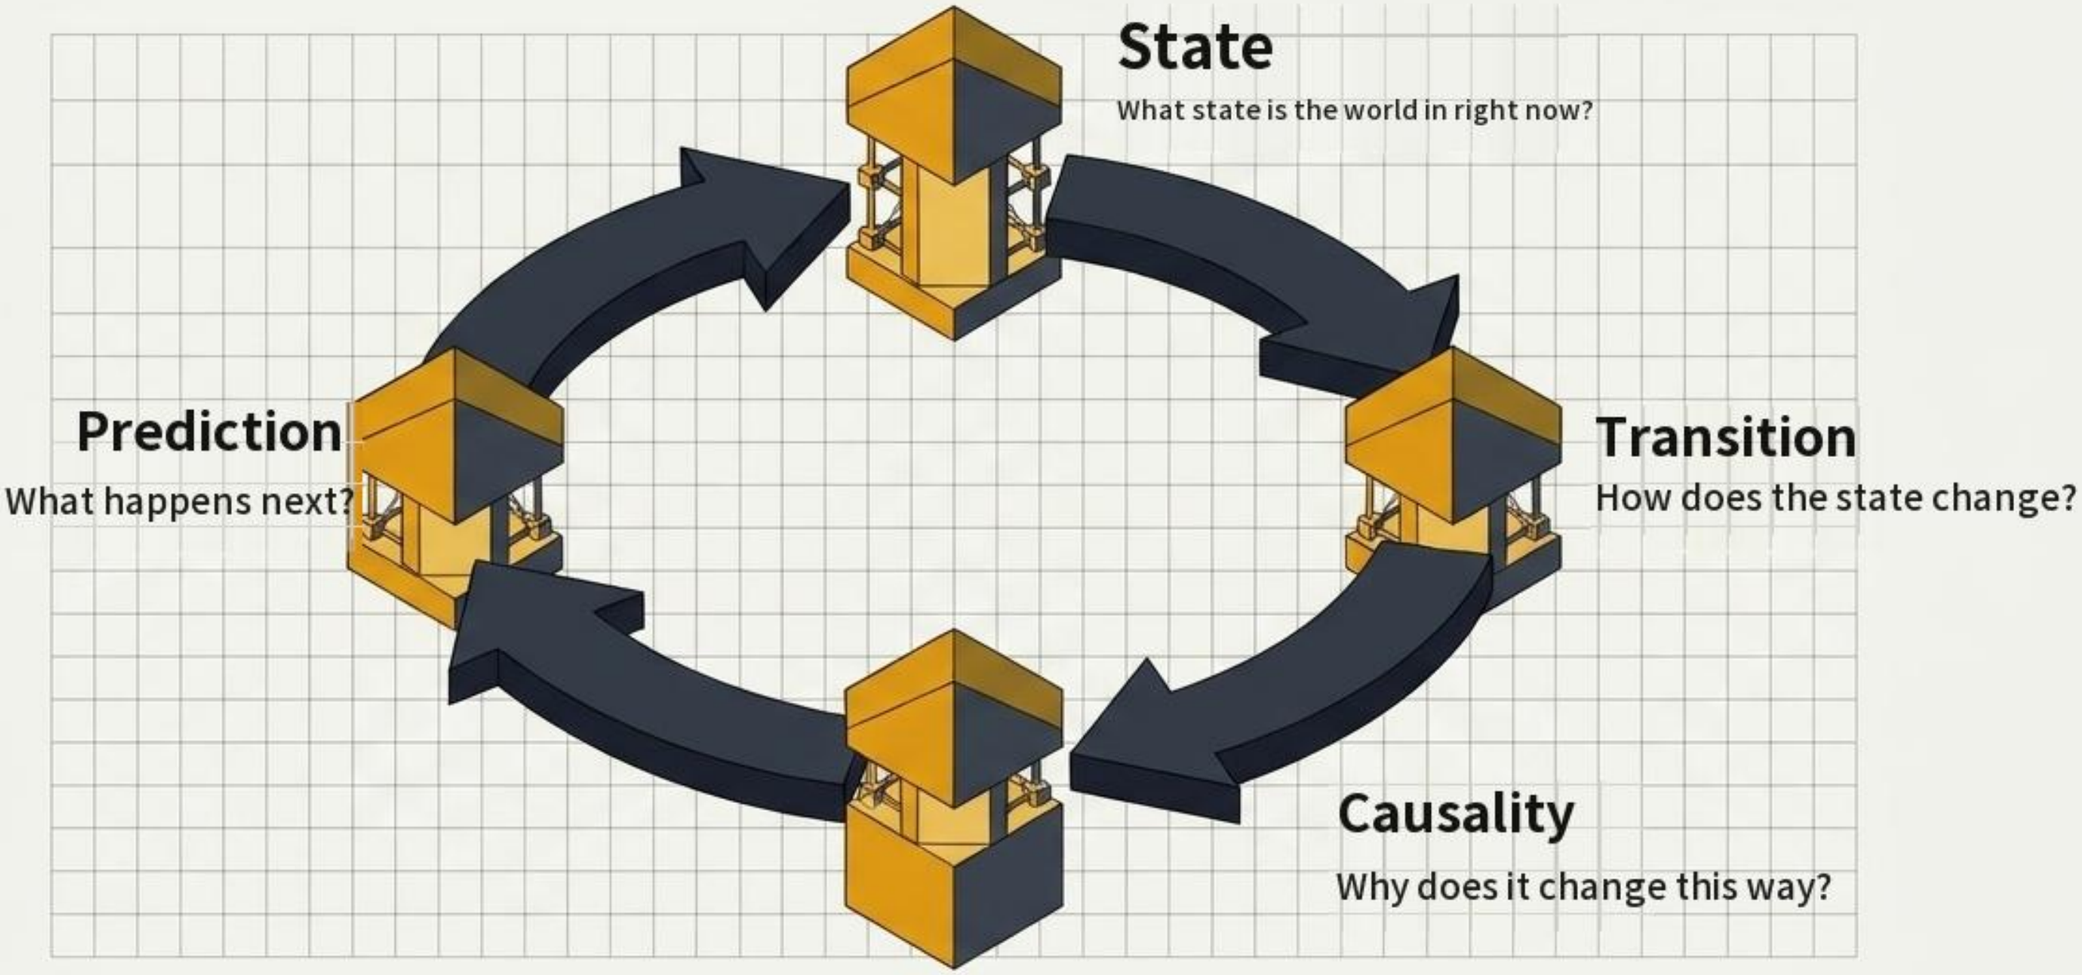

Robots enter real spacetime: it must grasp embodiment scope, temporal control, spatial localization and persistent identity.

Industrial AI

It demands ultimate trust on the factory floor: stable, reliable, traceable, a precisely controllable closed loop, deep domain knowledge and safety compliance.

MIND AI

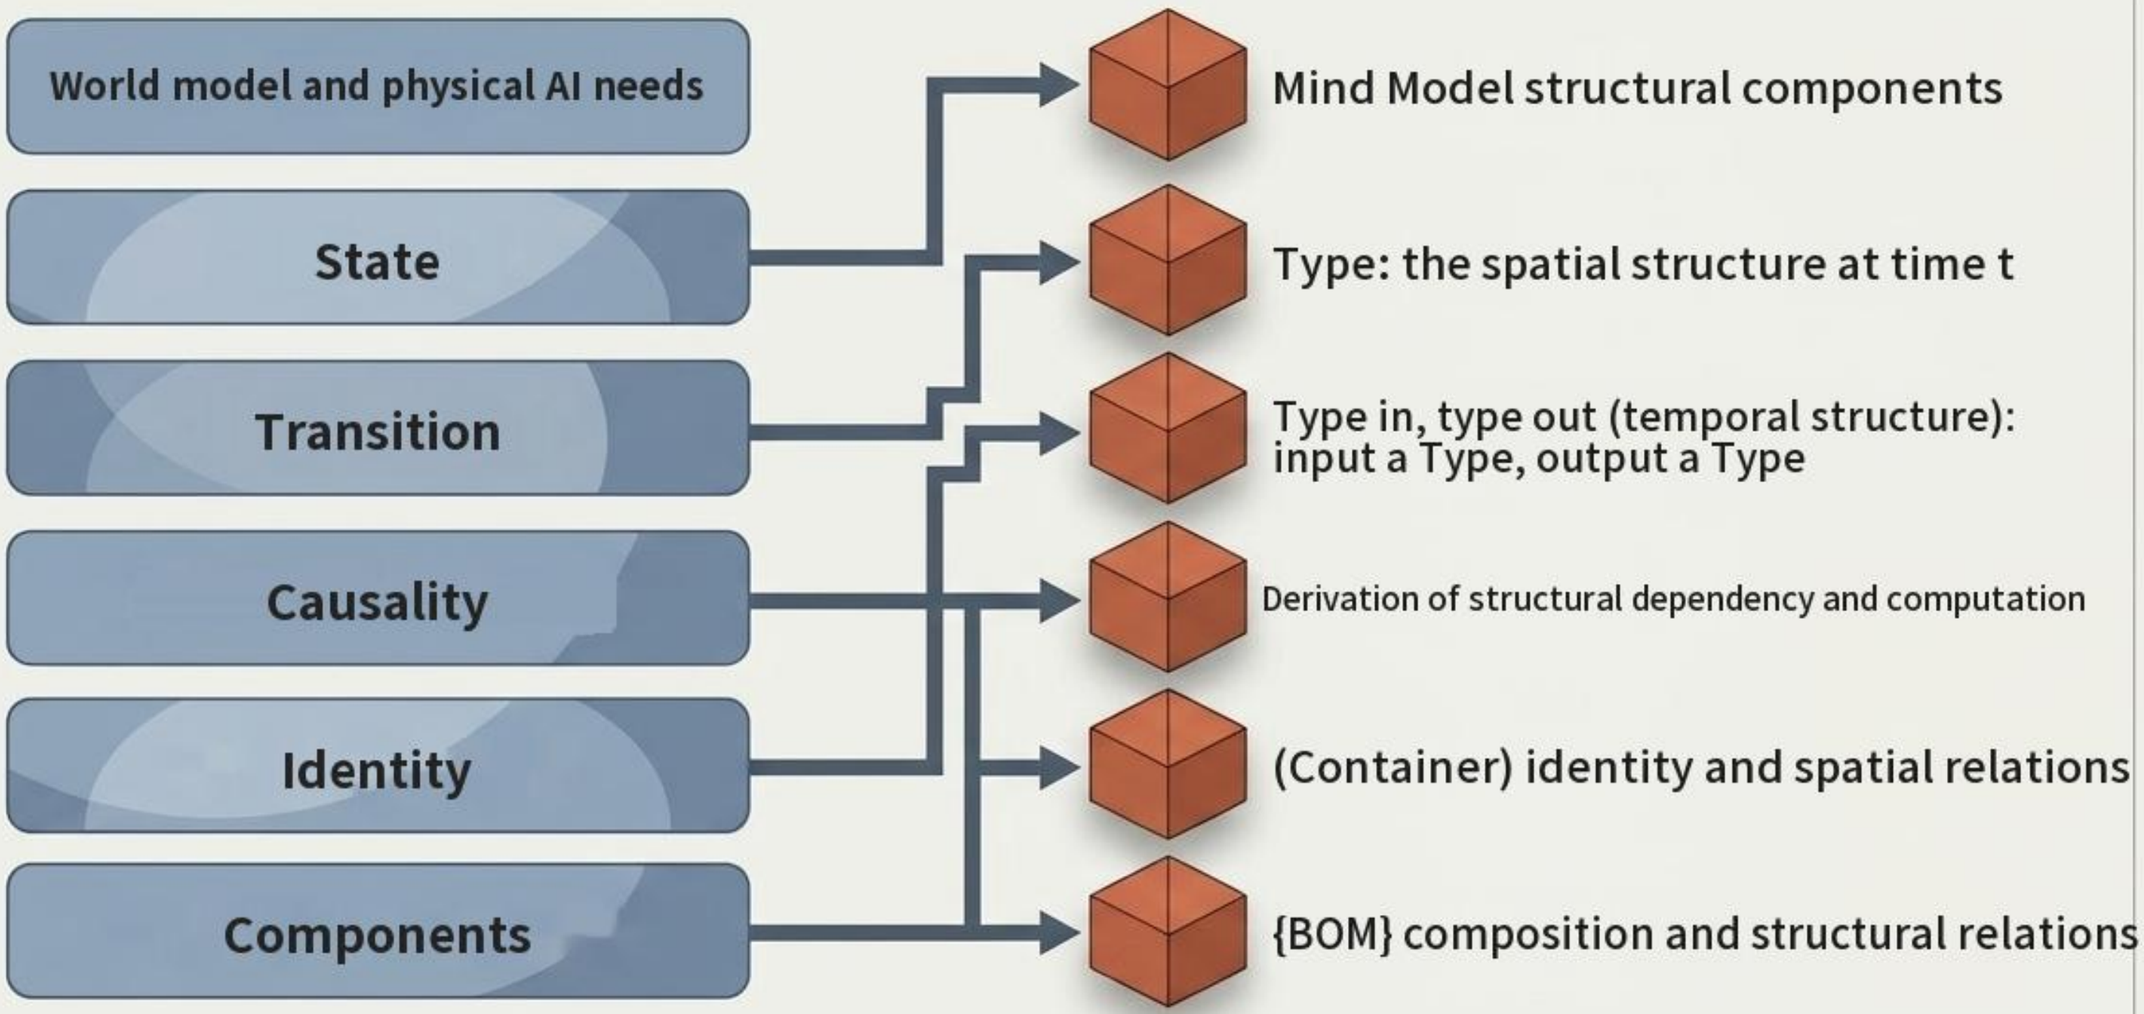

The ticket into a world model

Statistical weights describe what the world looks like; a world model must know what it is and how it will change.

MIND AI

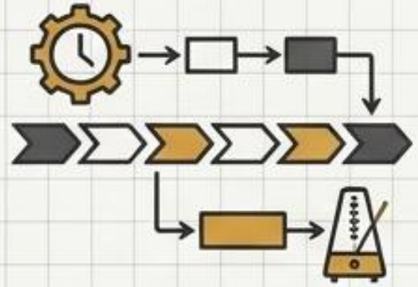

Alignment mapping: why Mind Model is the only base for a world model

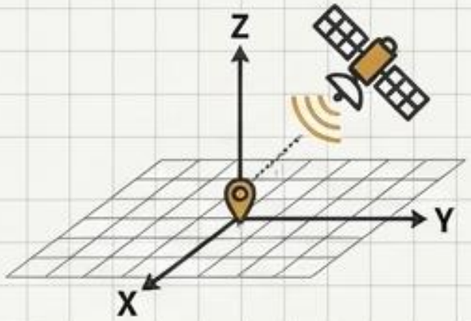

What does physical AI need?

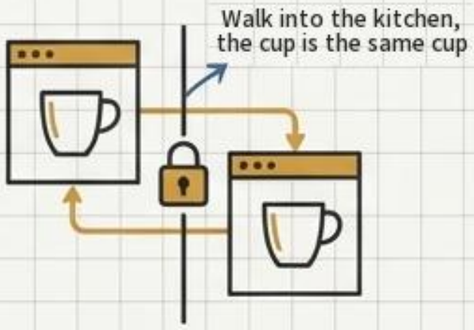

Embodiment

Temporal control

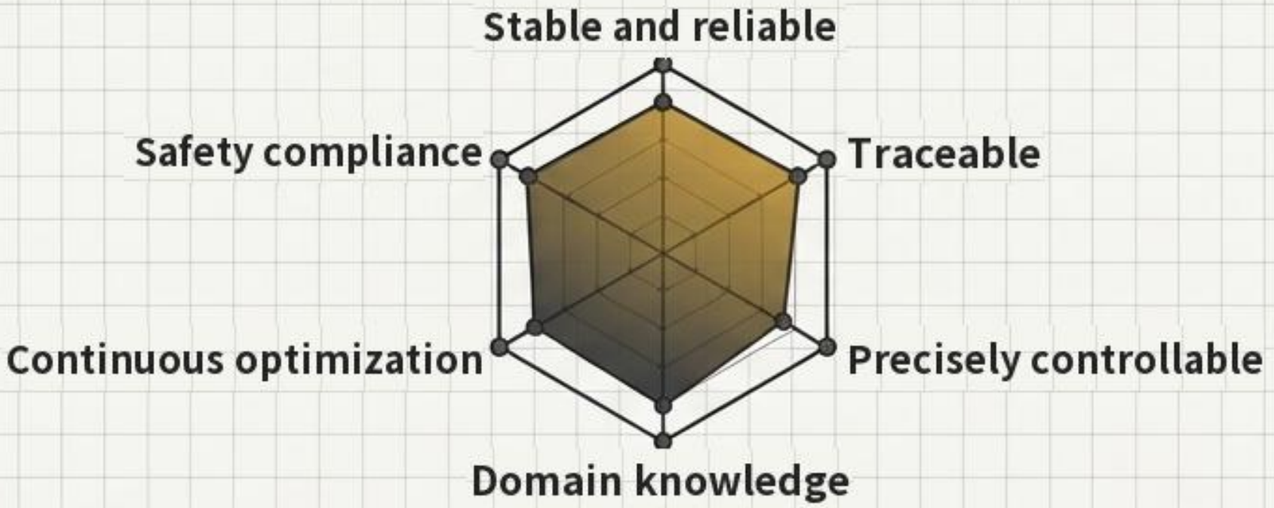

Spatial localization

Persistent identity

(Walk into the kitchen: the cup is still the same cup)

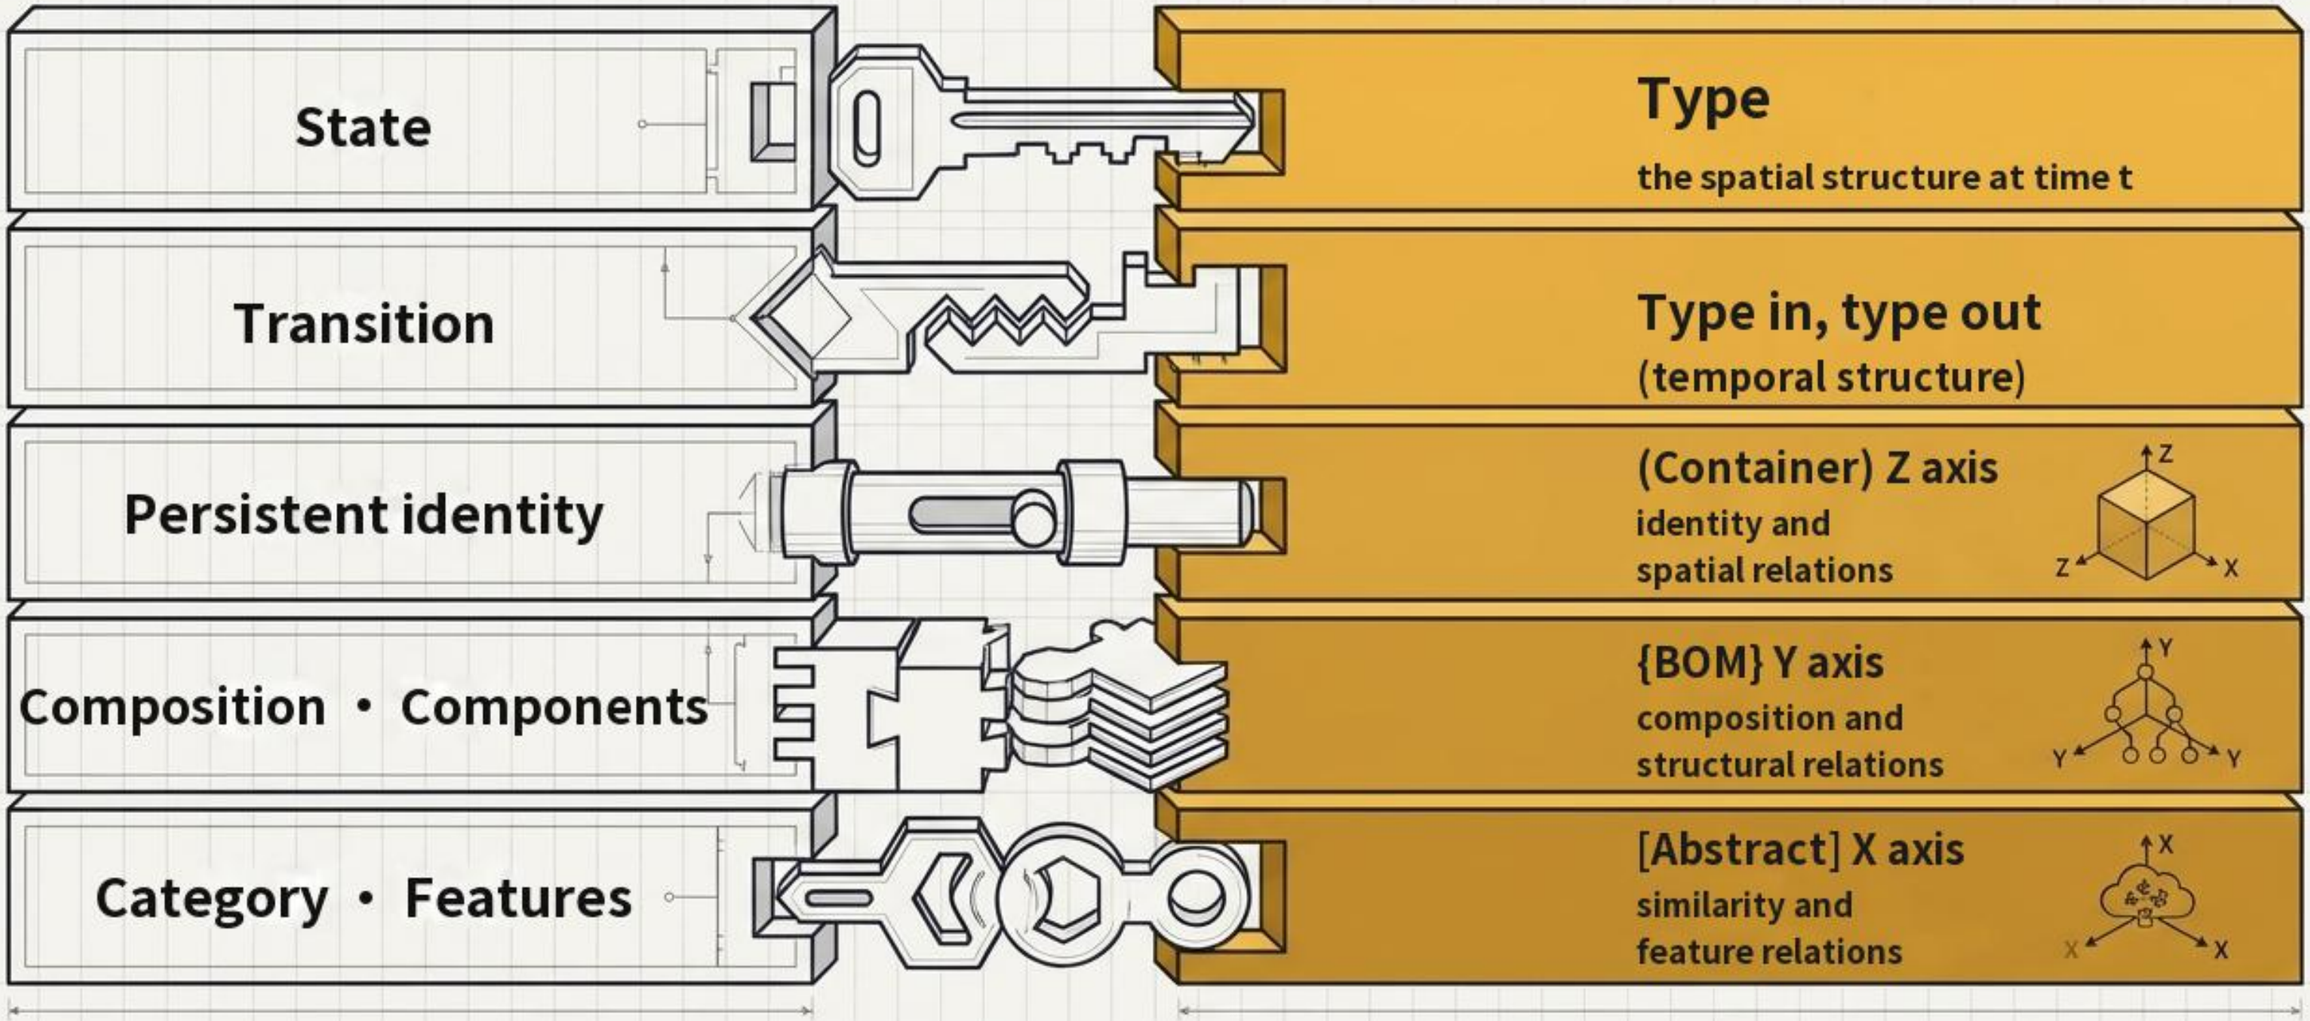

What does industrial-grade AI need?

The factory floor wants not 'wow' but 'trust': demands of 'structure', not 'probability'.

MIND AI

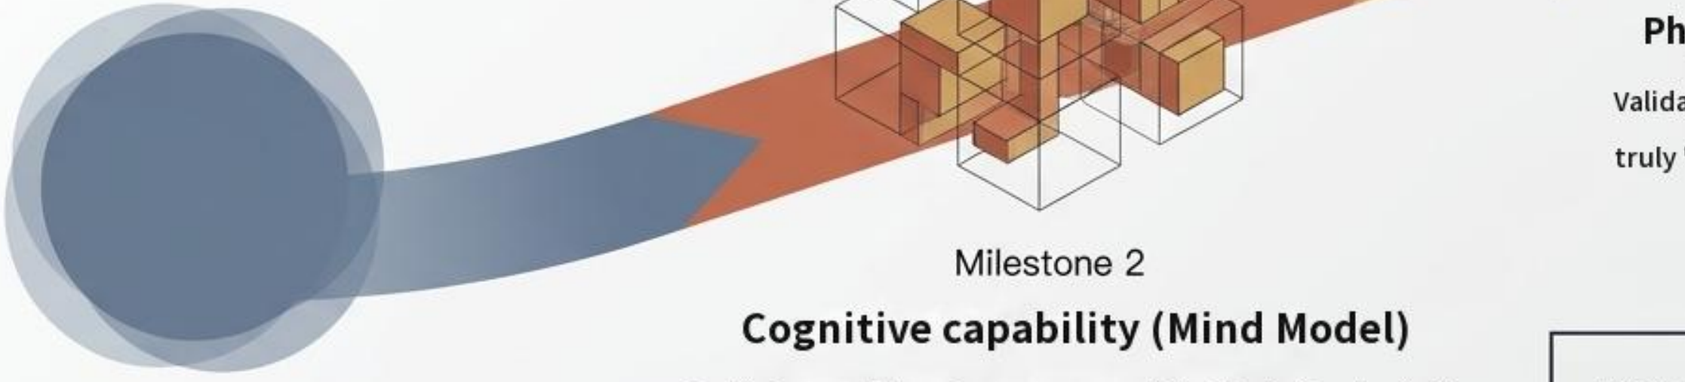

Precise structural alignment

MIND AI

The ultimate relay of cognitive compression:

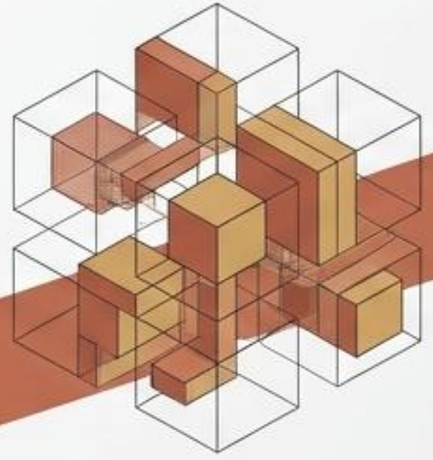

From relations to structure, from structure to understanding

Milestone 1

Language capability (LLM)

Language pressed into weights of flat relations, the machine learned to 'speak'.

Milestone 2

Cognitive capability (Mind Model)

Spatiotemporal structure compressed into 3D relational weights, the machine mastered "inferable states and identity".

Milestone 3

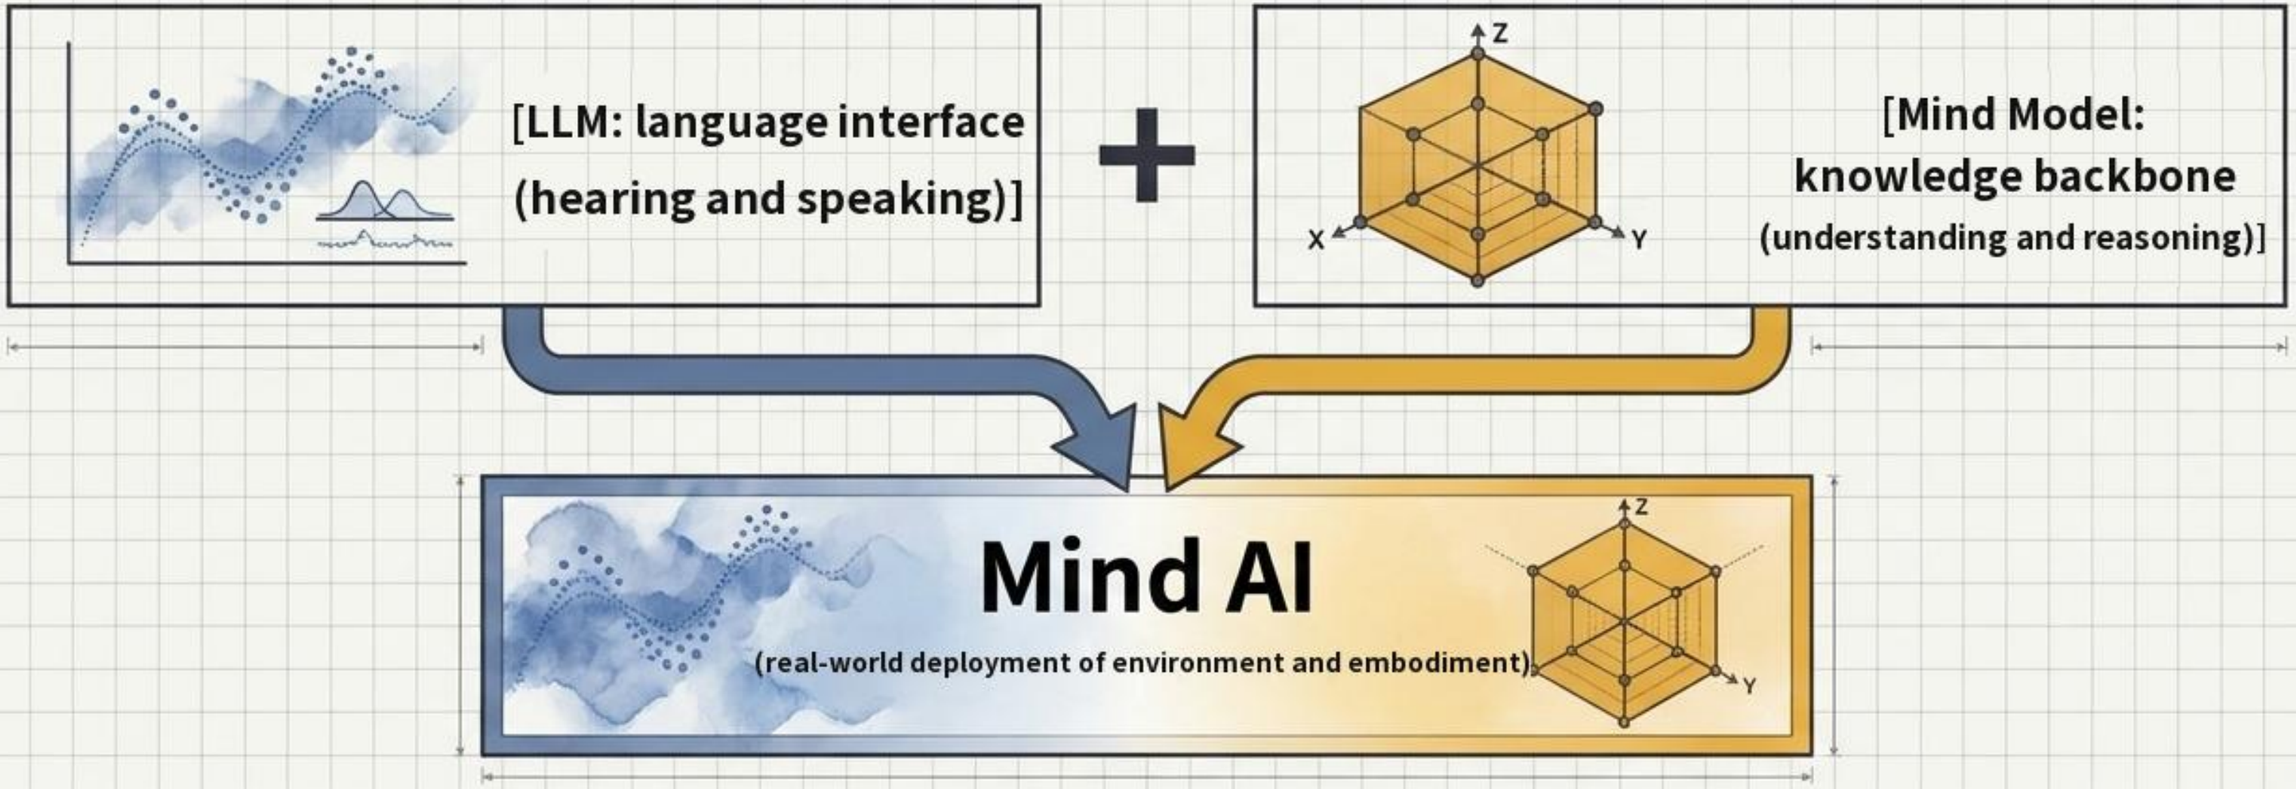

Physical embodiment (Mind AI)

Validated in real space-time, the machine truly "understands the world".

Two paths: not rivals, but a relay.
The pinnacle of the language plane meets the spatiotemporal backbone — this is the blueprint of next-generation AI.

MIND AI

The complete intelligent system

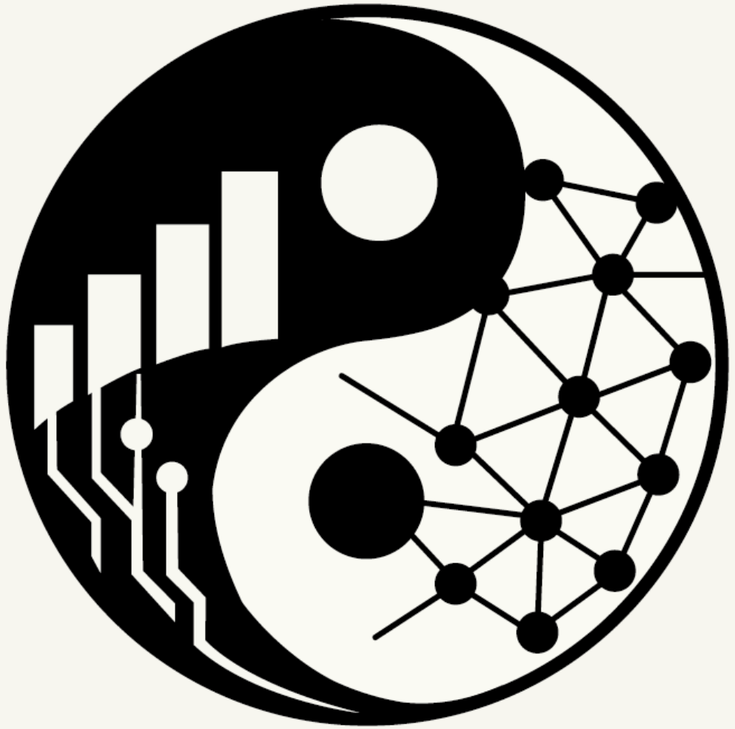

From token relations to spatiotemporal structure, to an understandable world.

The two paths are not rivals, but a relay.

MIND AI

LonGreat Vision: to create intelligent life that understands the essence of the world

MIND AI

"We aim to make artificial intelligence not merely a tool, but a system of intelligent life that truly possesses the abilities to understand, reason, learn, and create."

From the unification of knowledge, to the unification of thought, and finally toward the unification of intelligence – this is the eternal path to AGI that LonGreat pursues.
