Ontypology

- From same and different to split and join, from split and join to Type, from Type to understanding - the brain walked this road for eons.
- Logic was philosophy a century ago; once seen clearly it becomes an explicit science
- Today we study the "Type" (a brain concept). It is philosophy; Ontypology sees the Type clearly, turns it into an explicit science and puts it into practice as Mind AI.

The Blueprint of Existence and Type:

How Ontology and Ontypology Relate, and How to Practise Them

Ontology × Ontypology

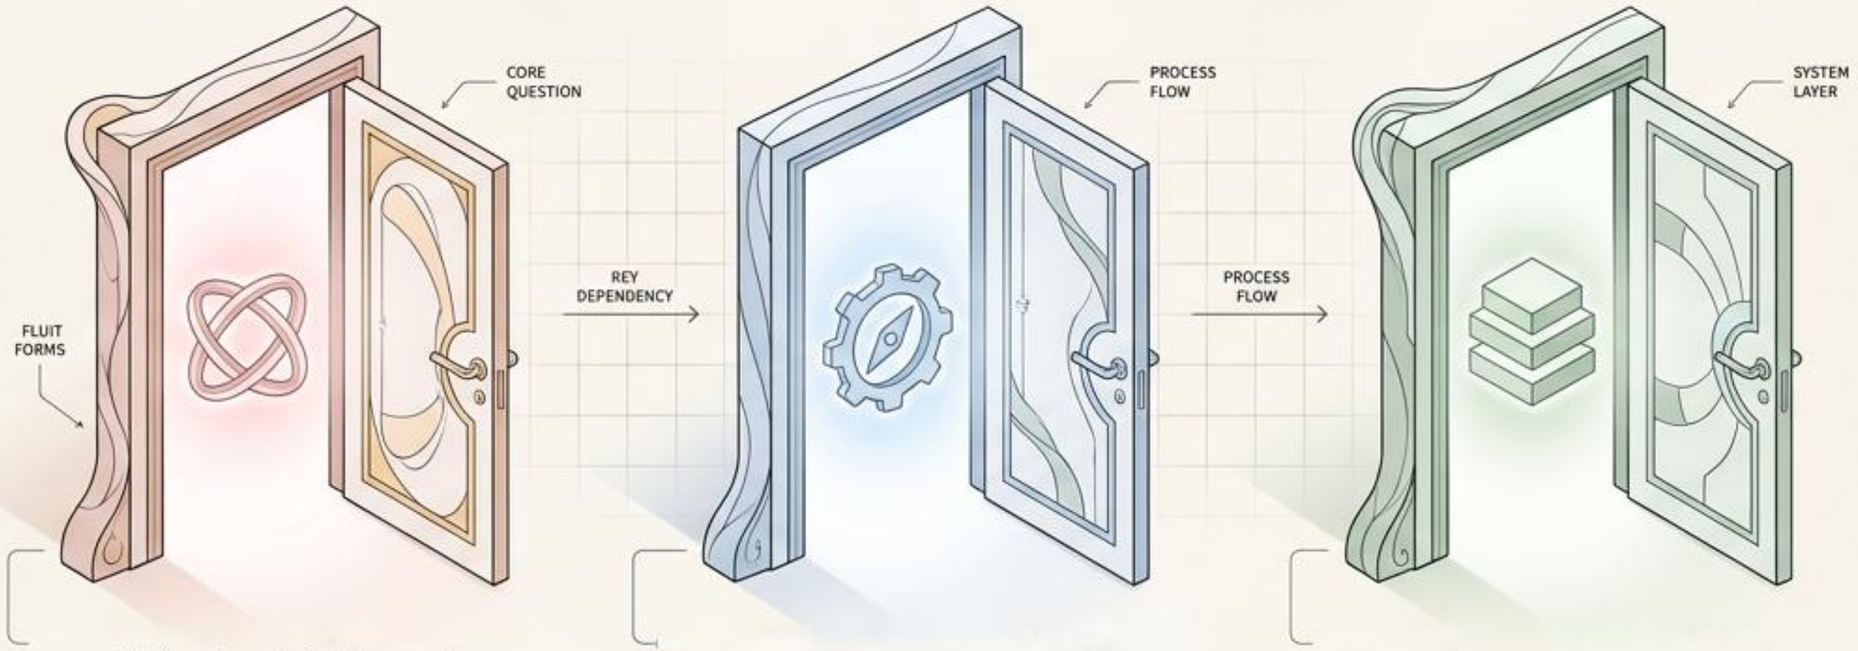

Accurate usage and architecture — the complete content plan

MIND AI

The Pastel Blueprint

How to read: look at the diagram first for intuition, then read the definitions.

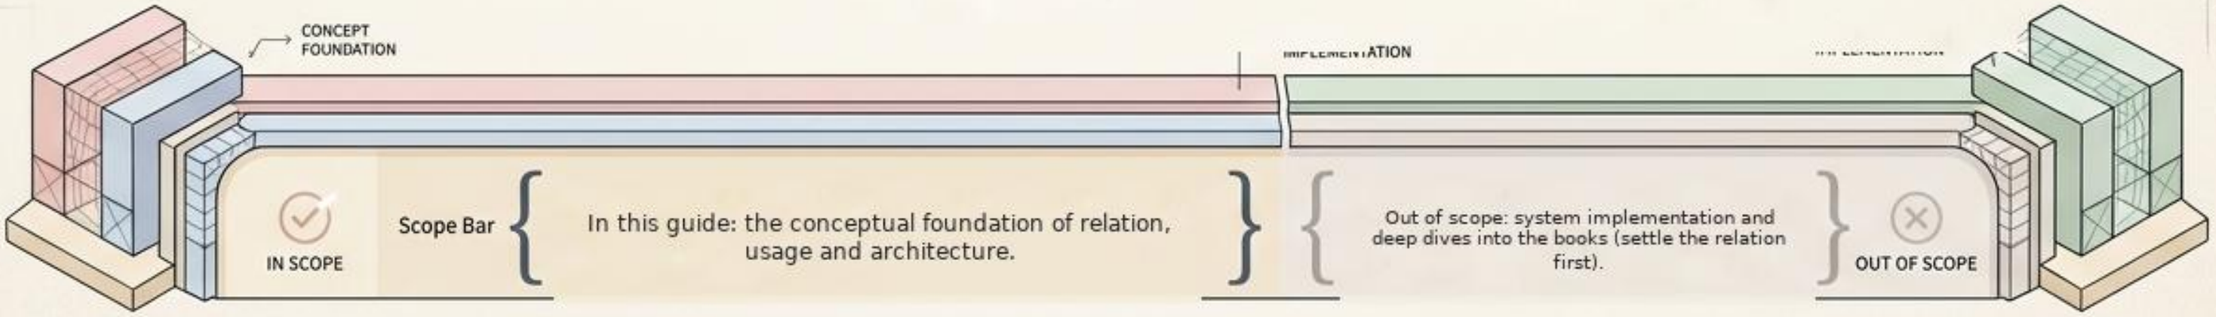

The Three Core Questions of This Guide, and What It Covers

Relation: how do Ontology and Ontypology relate?

Usage: how to use it accurately — which questions to ask, which steps to follow, and how to avoid misuse.

Architecture: what is the overall frame — which layers, what each layer owns, and how they hand over to each other.

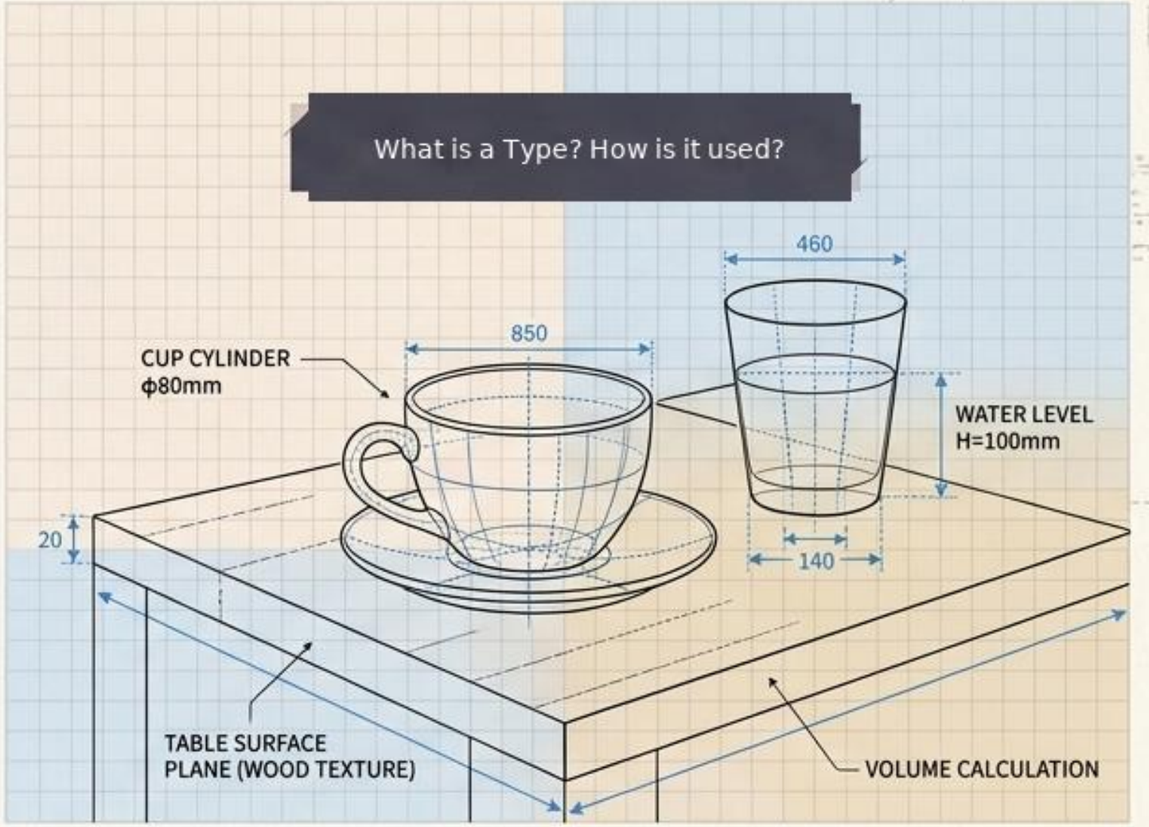

MIND AI

Two Disciplines: From "Seeing What Exists" to "Seeing Boundaries Clearly"

Ontology

The root of philosophy. It asks "what is there in the world?" and lists things one by one — first admit what there is, then everything else can be discussed.

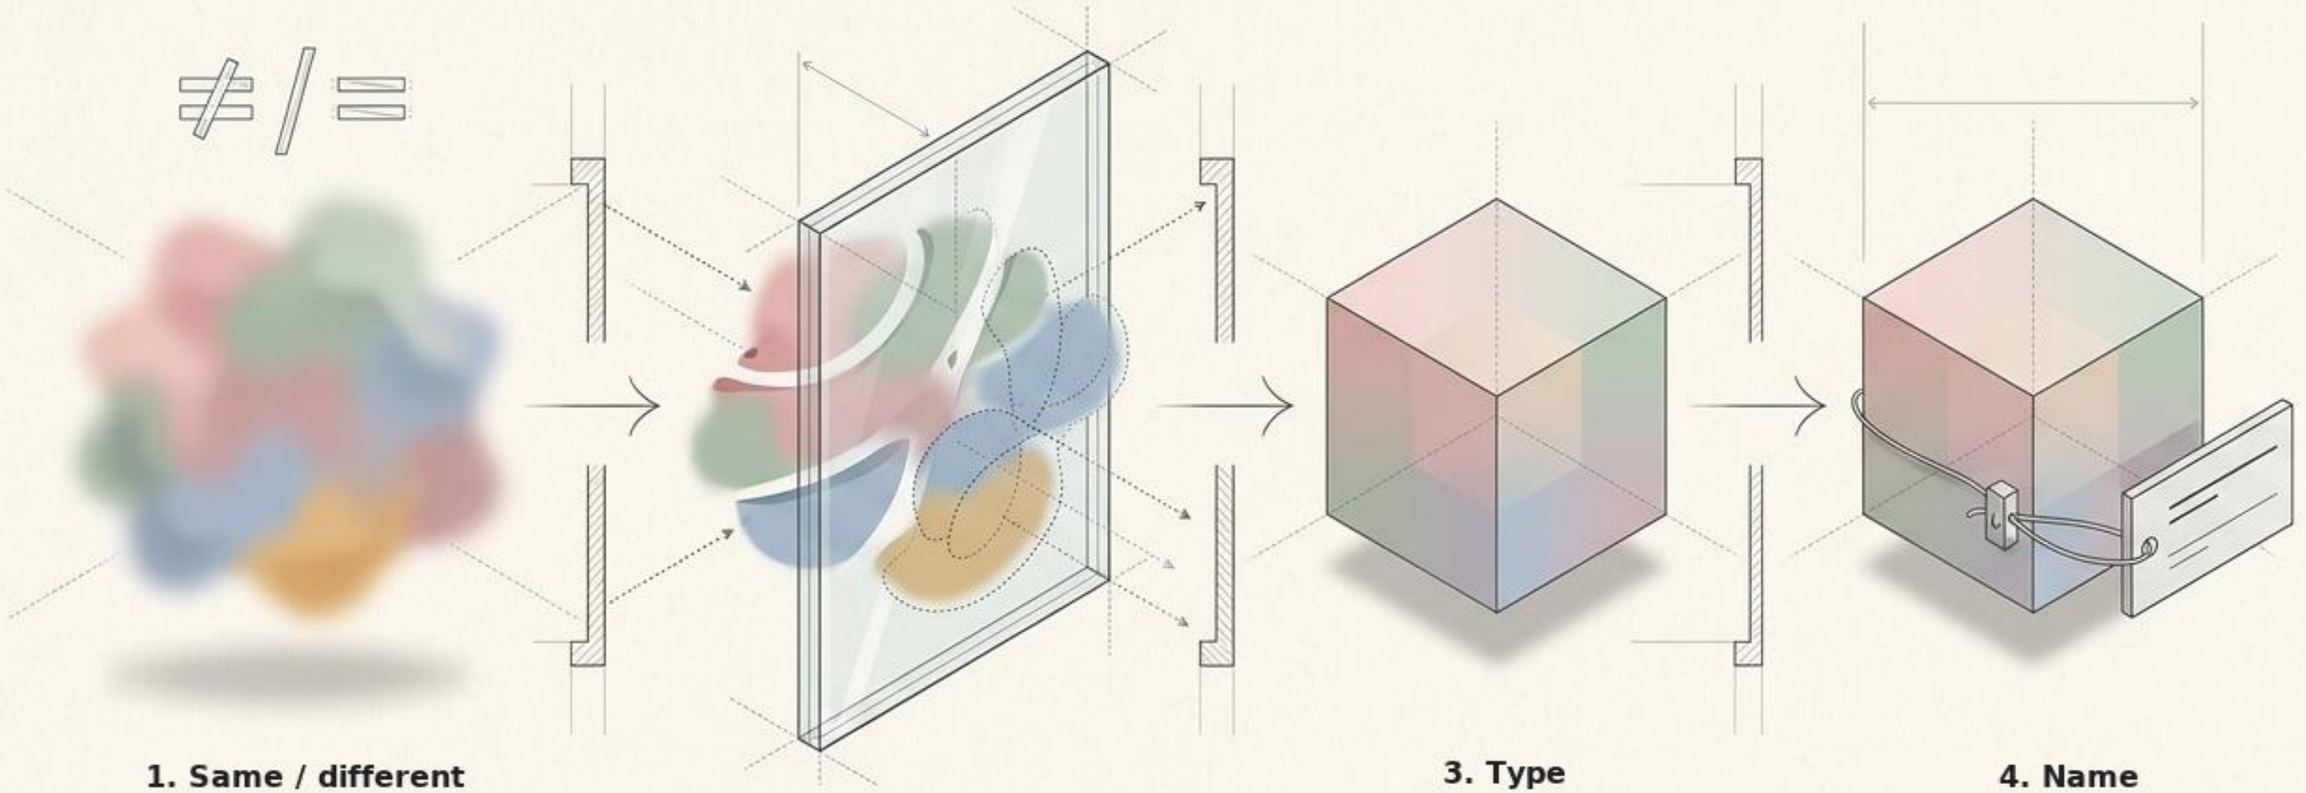

Ontypology

ont (existence) + typology (the study of types). It turns "existence" into "Type"; by seeing the Type clearly, philosophy becomes a teachable, trainable, re-checkable explicit science.

MIND AI

How a Type Is Born: The Four-Stage Cognitive Chain

1. Same / different

The first Type of cognition. A feeling of "this ≠ that".

2. Split and join

Cut what differs apart, ring what is the same together.

3. Type

The birth of a boundary. What we ring off, we can recognise.

4. Name

Every Type must have a name. A Type can be pointed at and talked about again.

Root and Trunk: Six Faces of Two Disciplines

In one line: Ontology answers "what is there"; Ontypology answers "what a Type is and how to use it". The first is the root, the second the trunk.

	Ontology	Ontypology
Core question	What is there? How does everything come to be what it is?	What is a Type? How to recognise, name, record, judge and operate it?
Basic unit	**Existence, entity**	**Type, Unit Type**
Main output	A list and categories of what exists	Notation, judgement and frame of Types
Language used	What it is, what it has, which category	Type Set {parts, (content), [category]}
Nature	The root of philosophy — where questioning starts	An explicit science — teachable, trainable, re-checkable
Direction	**Understand the world**	Put the Type to work: recognise, name, judge, operate

MIND AI

One Type, Two Faces: Space Type (body) and Time Type (use)

A complete Type = body + use. It has both "what it is" and "what it does" — neither can be missing.

Space Type

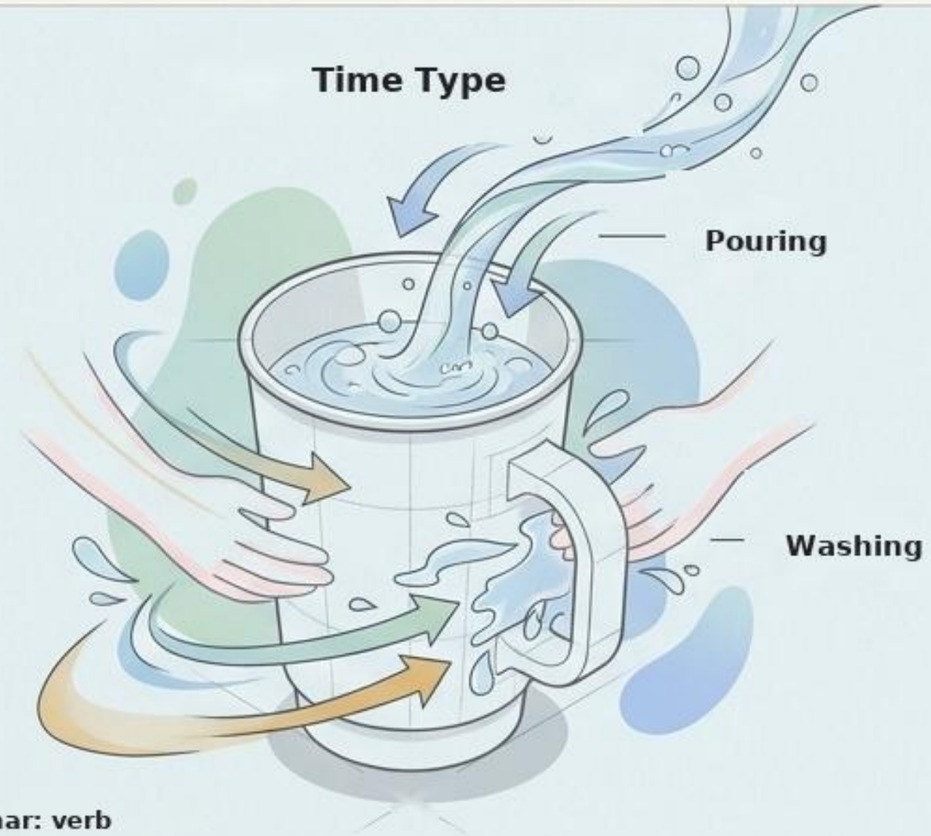

Grammar: noun

Nature: static structure (body)

Answers: what is it?

Contains: structure, parts, content, category

Time Type

Grammar: verb

Nature: dynamic operation (use)

Answers: what does it do? how?

Contains: the actions and methods applied to a Type

MIND AI

Body and Use as One; Type First, Action After: A Day in the Life of a Cup

The Type stays; functions act on it

In the morning the cup stands quietly on the table; filling, pouring and washing act on it one by one. What changes is the content; what stays is the Type.

Type first, action after

There must be a Type before there can be action. The Time Type rides on the Space Type.

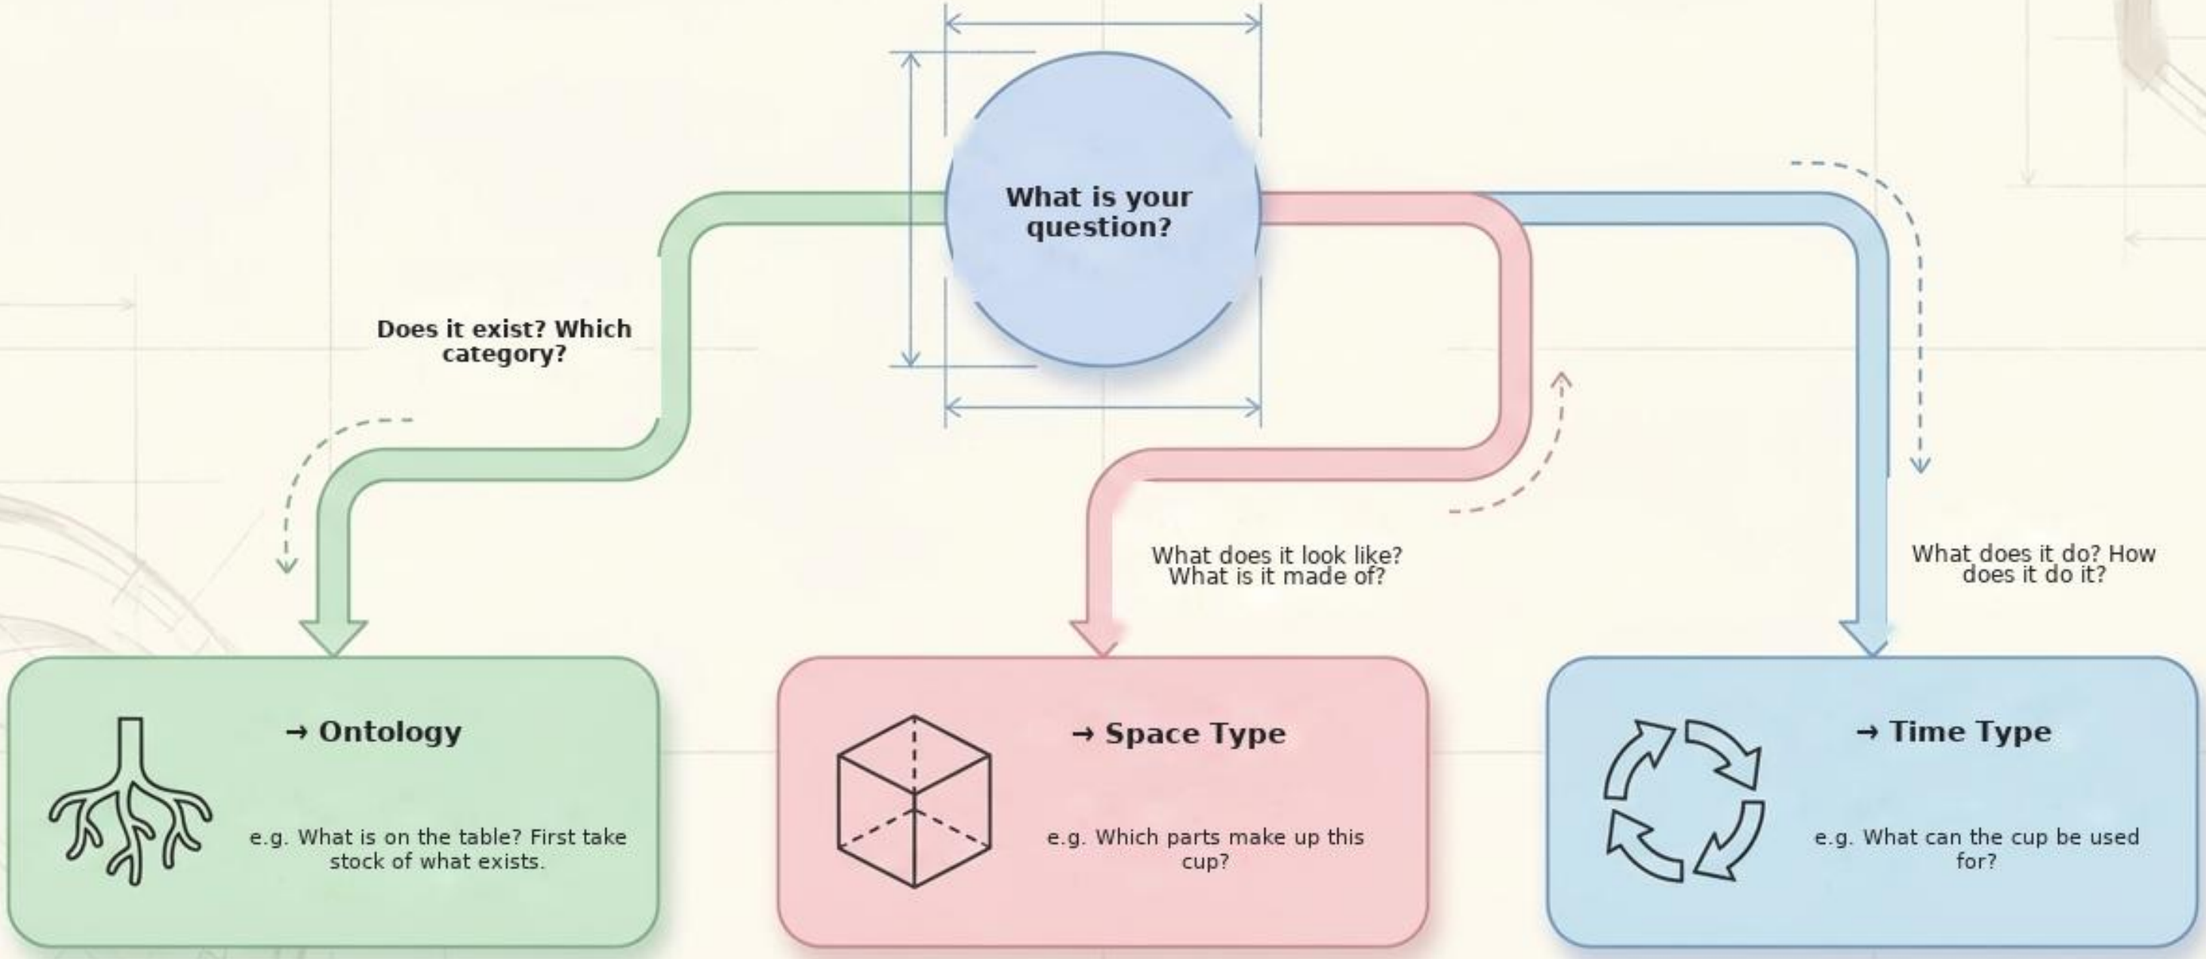

Each completes the other

Actions produce new Types; Types in turn support richer actions.

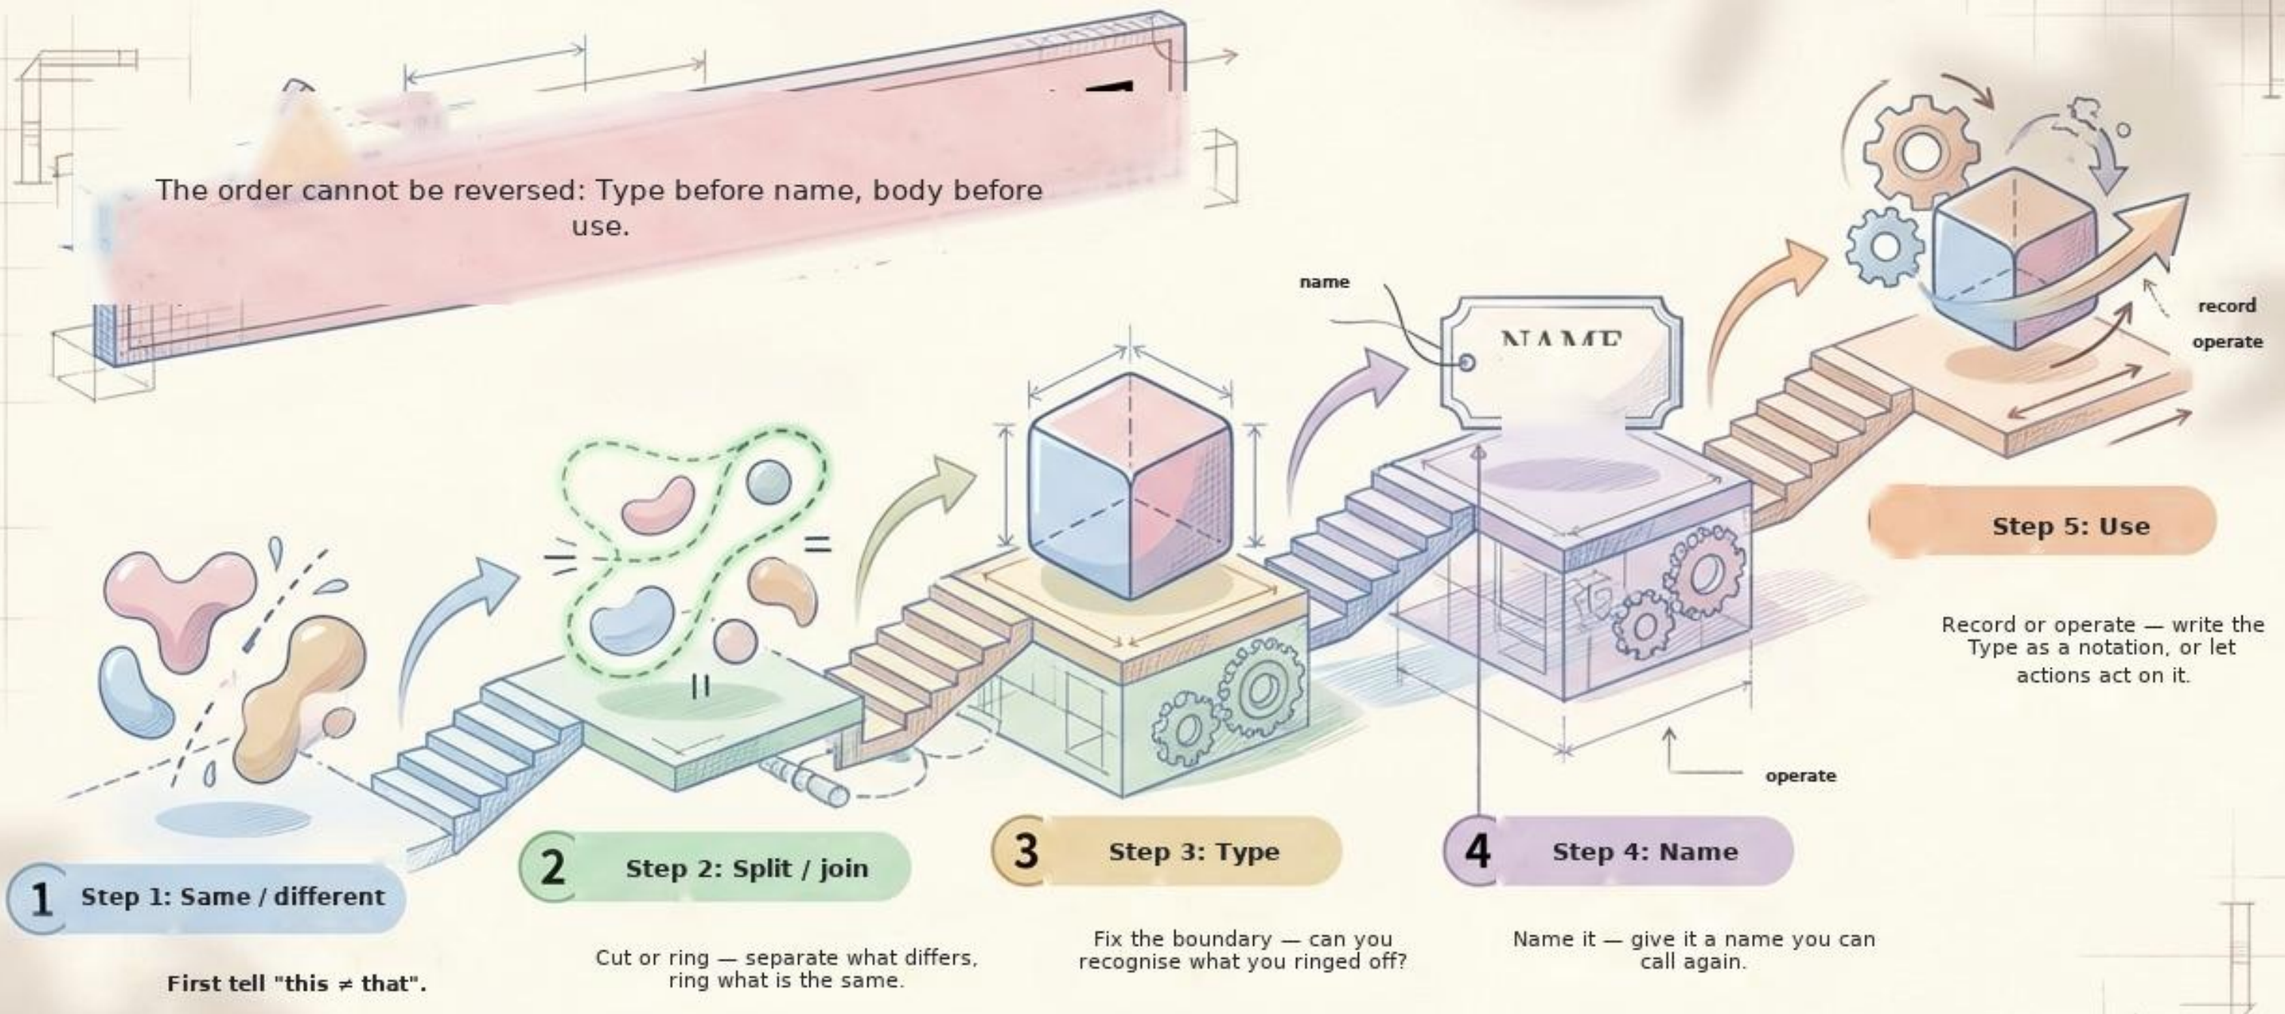

MIND AI

Step 1: The Triage Decision Tree

Mis-routing is the commonest mistake: answering "what is a Type" with a list of "what exists". Route correctly, and the method stands firm.

The Five-Step Method: From Telling Things Apart to Putting Them to Use

First tell "this ≠ that".

Cut or ring — separate what differs, ring what is the same.

Fix the boundary — can you recognise what you ringed off?

Name it — give it a name you can call again.

Record or operate — write the Type as a notation, or let actions act on it.

The Language of Space Type: Notation, Grammar, Equation

cup = {handle, body, lid} + (coffee) + [white]

Rule 1 · Fix the referent:

Decide whether you mean the physical thing or the conceptual Type.

Rule 2 · Body and use apart:

For the Type, list only parts, content and category; for the use, only the actions acting on it.

Rule 3 · Content varies, Type does not:

Fill it with water or coffee — it is still a cup. Always keep the Type apart from the (content).

MIND AI

Avoiding Misuse: A Self-Check List (Diagnostics Check)

[Red Flags] Common misuse and its fix

A list instead of a Type

Symptom: answering only "what exists" and thinking it is done.

→ Follow up with "what does it look like, what can it do?"

Use before body

Symptom: saying what it does before being clear what it is.

→ Establish the Space Type first, then the Time Type.

Name before Type

Symptom: naming first, then hunting for the boundary.

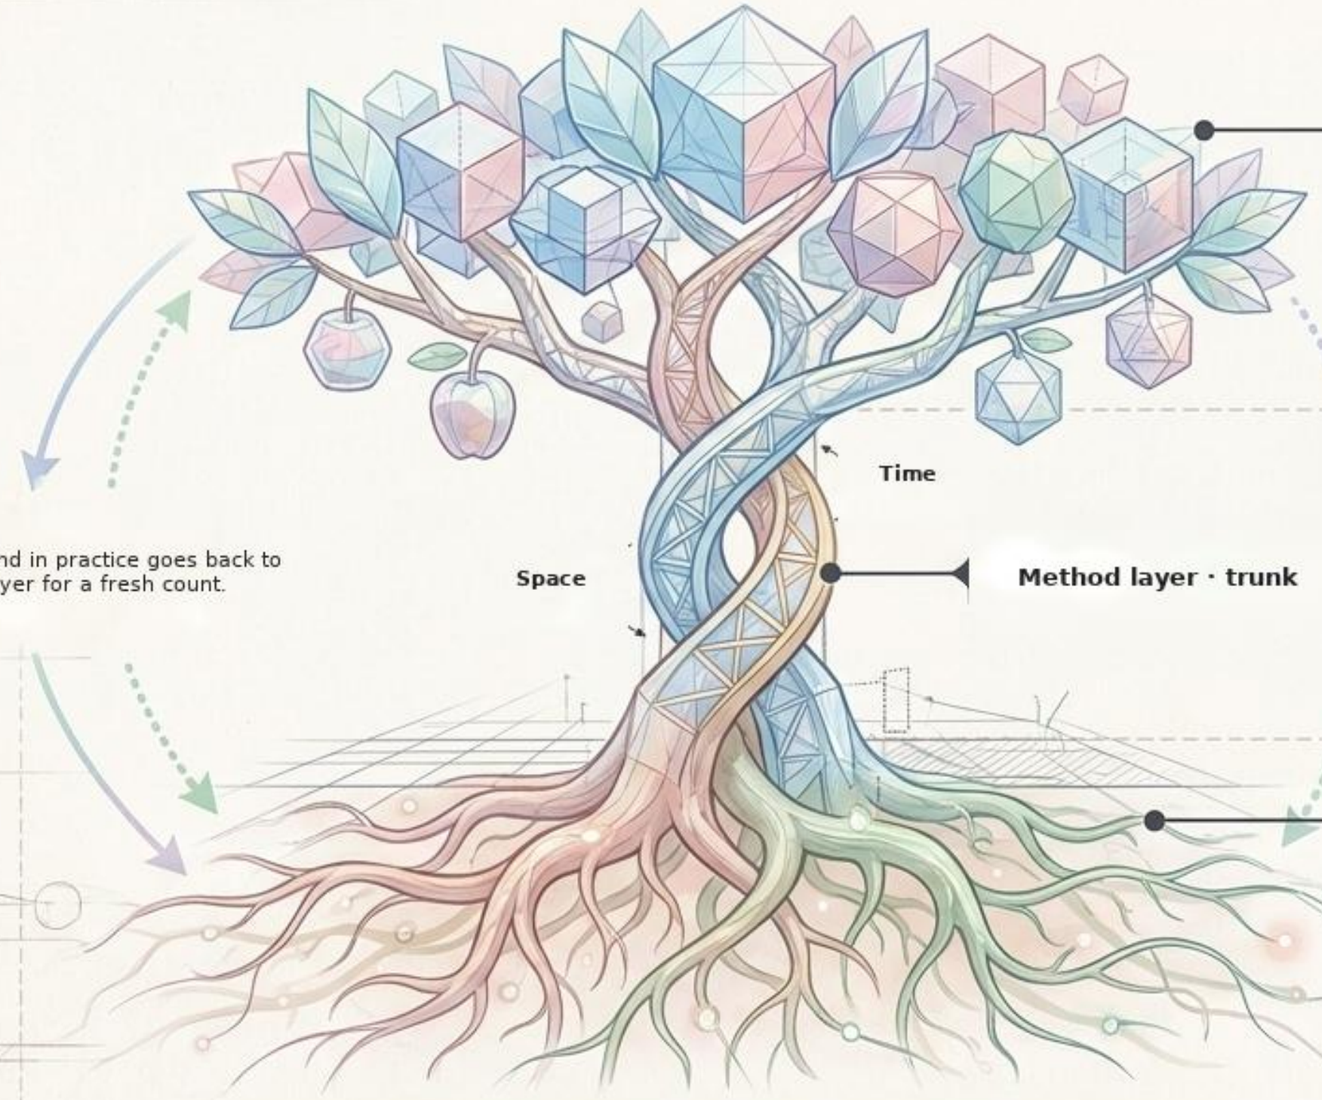

→ Follow the cognitive chain (same/different → split/join → Type → name).

[Green Checks] Before each use, ask yourself:

- Is this question routed correctly? (what exists / what it is / what it does)
- Did I ask "what exists" before "what is the Type"?
- Is the boundary of the Type found? Does the name match it?
- Is it Type before action, body before use?
- Have I mistaken the (content) for the Type?

MIND AI

Overall Architecture: Philosophy, Method and Practice Layers Working as One

Practice layer · fruit

application

executable recognition, judgement, operation

Ontypology

Method layer · trunk

asks "what is a Type, how is it used"

output: notation, judgement, frame

Philosophy layer · root

Ontology

asks "what exists"

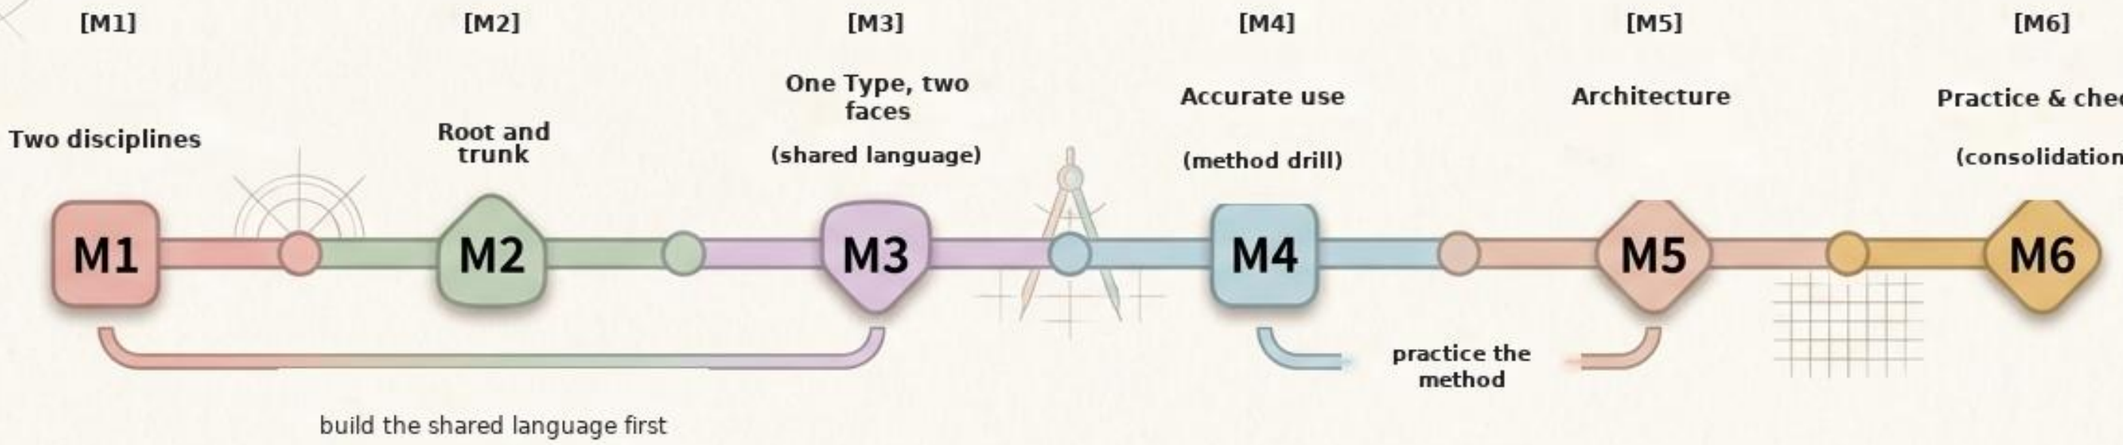

output: list and categories

New "what exists" found in practice goes back to the philosophy layer for a fresh count.

Handover rule: the root's output is the trunk's input. The order cannot be reversed. The architecture is alive, not a one-way street.

MIND AI

The Complete Content Plan: Modules and the Learning Path

The Pastel Teaching Method (Teaching Suggestions)

1. Picture before text

Look at the diagram first to build intuition, then read the definitions.

2. Example before rule

Start with everyday examples like the cup, then converge on the rule.

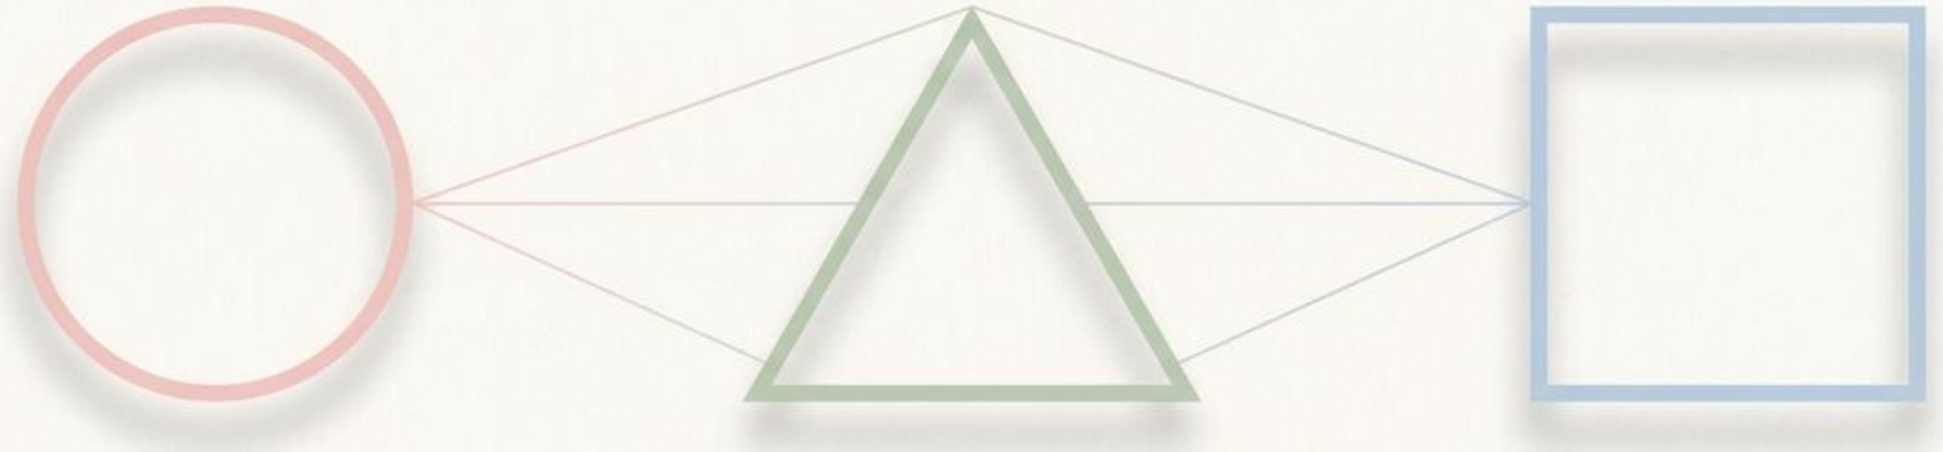

3. Learn by doing

Each module walks its own example through the five-step method.

MIND AI

Summary: See "Existence" Clearly, Use "Type" Accurately

Relation: Ontology asks "what exists"; Ontypology asks "what a Type is and how to use it" — root and trunk.

Two faces: Space Type = noun (body); Time Type = verb (use); a complete Type = body + use.

Use and architecture: use follows triage → five steps → check; the architecture runs philosophy → method → practice layer.

Ready to start? Take the triage tree and the five steps and run one round on an example close to you.

Appendix: One-Page Cheat Sheet (Master Cheat Sheet)

Glossary

Ontology: the study of existence (what there is)

Ontypology: the study of Types (what a Type is / how it is used)

Space Type: the "body" of a Type (noun)

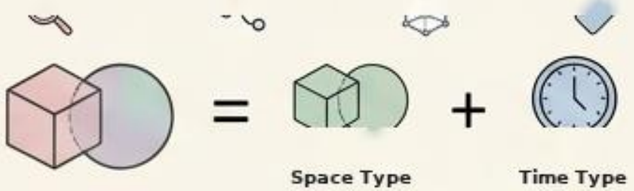

Time Type: the "use" of a Type (verb)

Core Rules

Cognitive chain: same/diff → split/join → Type → name

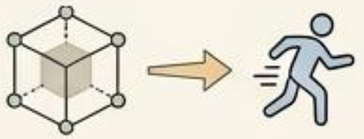

Body and use as one:

a complete Type

Type before action:

there must be a Type before there is action

Syntax & Triage

Type Set = { **parts** (content), **[category]** }

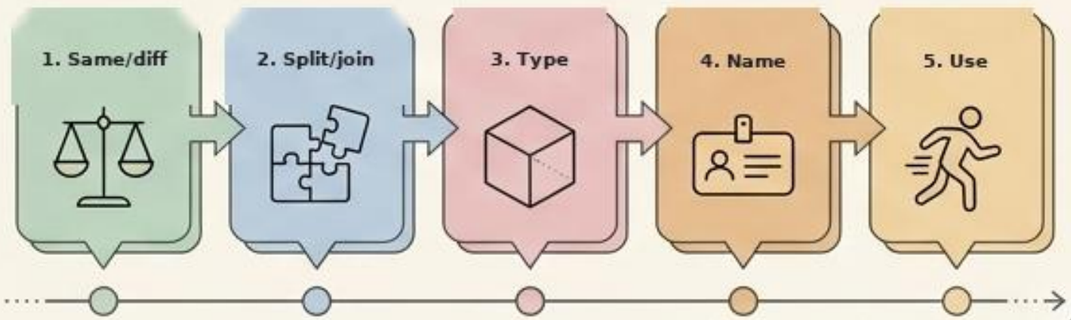

Triage:

belonging (Ontology) → **belonging (Ontology)**

belonging (Ontology) → **structure (Space)**

belonging (Ontology) → **action (Time)**

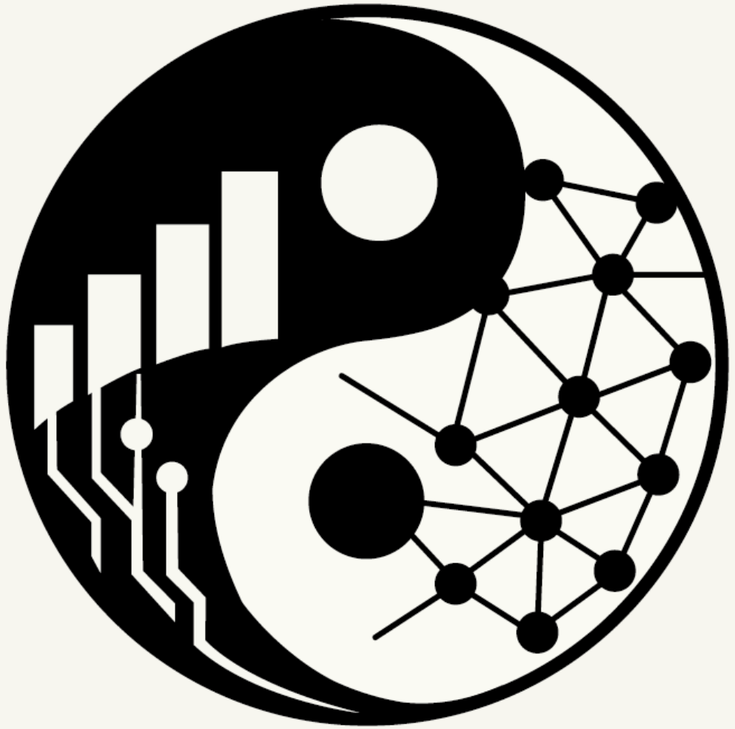

The 5 Steps

MIND AI

LonGreat Vision: intelligent life that understands the essence of the world

MIND AI

"Let AI be more than a tool - a living intelligence that can truly understand, reason, learn and create."

From unified knowledge to unified thought, then to unified intelligence - this is the eternal path to AGI that LonGreat pursues.
