Ontypology

- From same and different to split and join, from split and join to Type, from Type to understanding - the brain walked this road for eons.
- Logic was philosophy a century ago; once seen clearly it becomes an explicit science
- Today we study the "Type" (a brain concept). It is philosophy; Ontypology sees the Type clearly, turns it into an explicit science and puts it into practice as Mind AI.

The Brain of the World Model

From Large Language Models to Structured Cognition: A System Blueprint for Ontypology and Mind AI

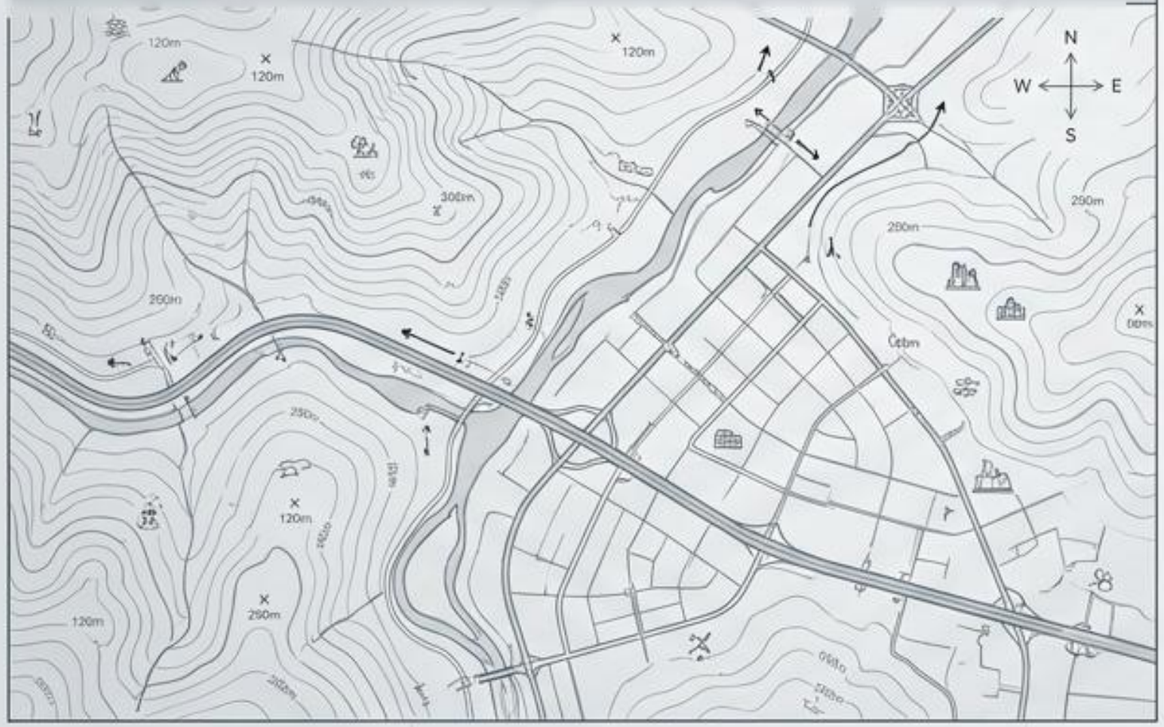

Theoretical basis: Space Type · Time Type

Platform layer: Mind AI

MIND AI

Paradigm Shift: From a Precise Map to a Thinking Brain

Map (describes the world)

Brain (thinks about the world)

- marks junctions and distances
- **understands and speaks**
- **relies on black-box features**
- no prediction, no responsibility

World Model = the world's Type (space) + the world's time + judgement and reasoning (brain)

- **predicts the next moment**
- **simulates "what if?"**
- **a clear, auditable record**
- **accountable for outcomes**

MIND AI

Where Cognition Starts: Turning Everything in the World into a Type

( ) Operation (Time Type):

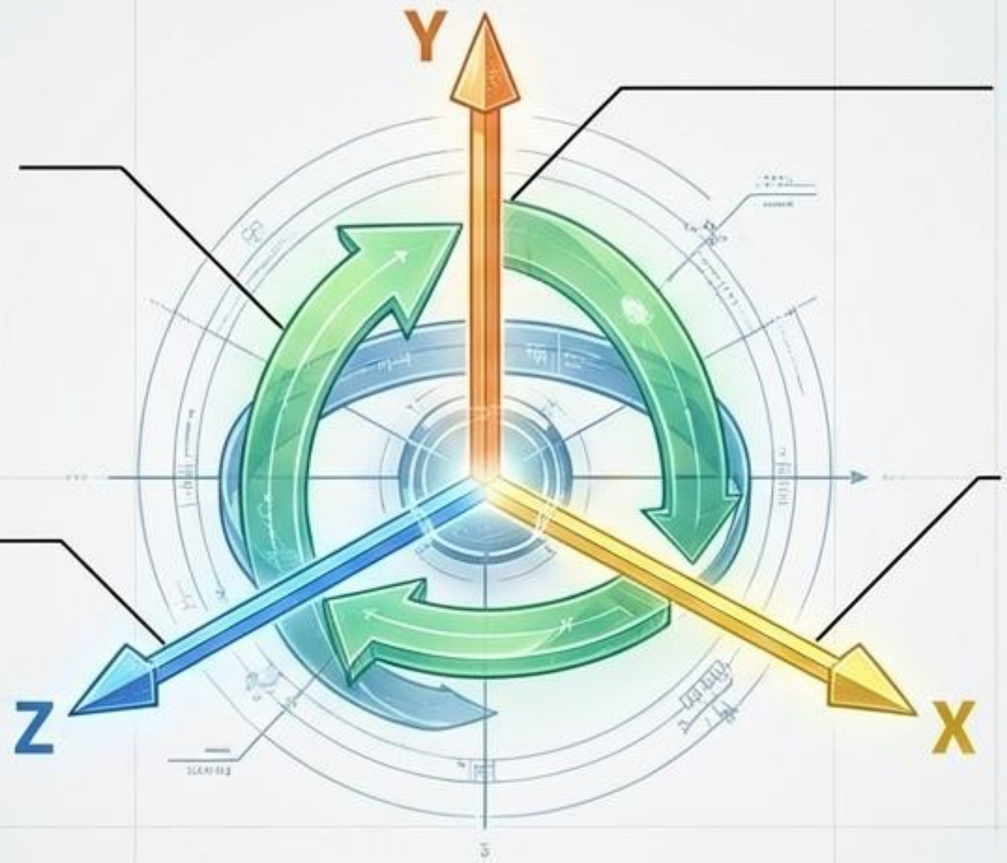

How does the world work?

(functions and moves)

( ) Container (Z axis):

Where do things sit?

(identity and boundary that do not change)

{ } Composition (Y axis):

What is the world made of?

(bill of materials / BOM)

[ ] Property (X axis):

What does the world look like?

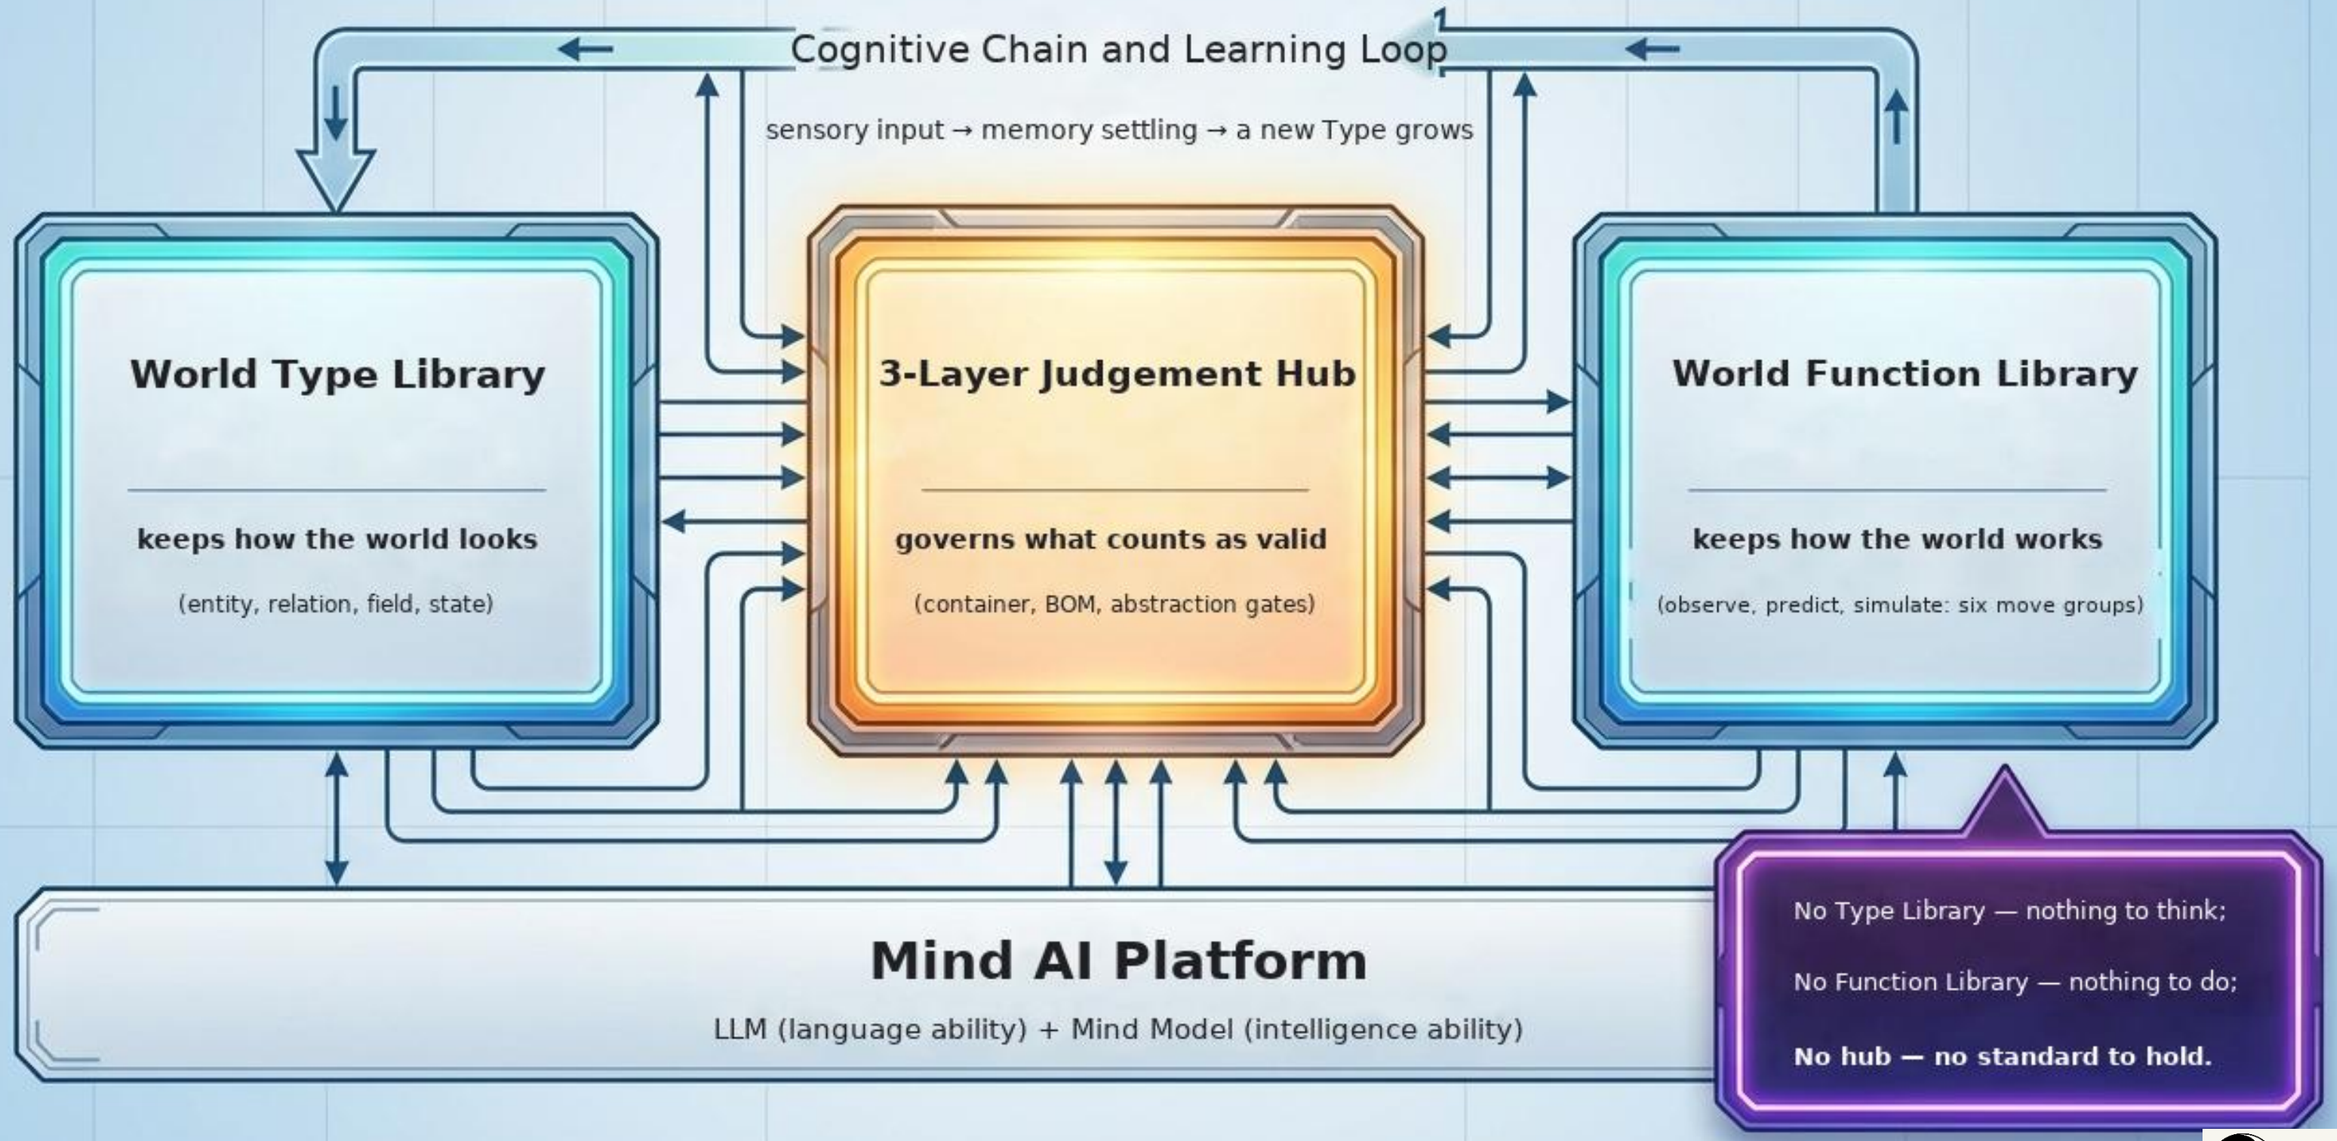

(dimension × scale)

Identify → **Split & Join** → **Build Type Set** → **Name It**

(where there is composition there is a Type; Type first, number after.)

MIND AI

Anatomy of the Brain: The Overall System Architecture

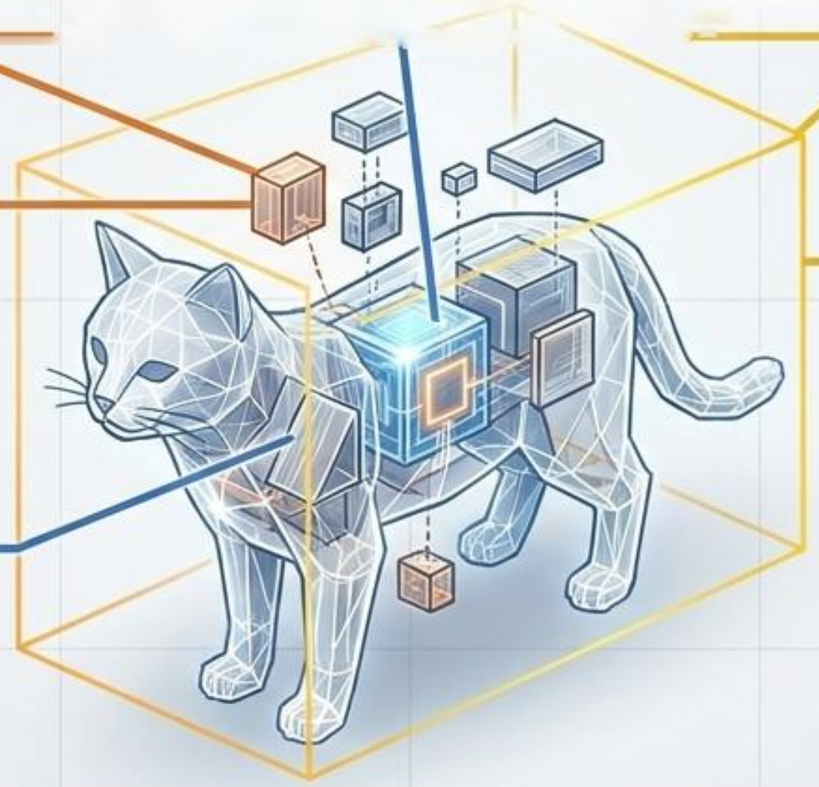

Space Type: Writing the Static World as a Type Set

{parts, (content), [category]}

bones, organs, fur

(without the heart it is no longer a living cat)

[mammal]

(orange-white, three years old, 4.2 kg —

these are scale properties)

(food) / identity id:

this cat is called A-Ju; today in the

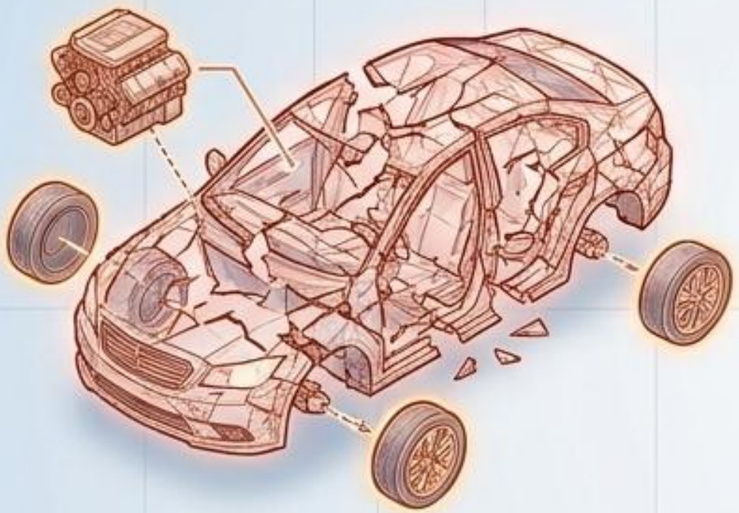

living room, tomorrow the yard — id unchanged

Handover rule: one line per Type, anyone can look it up and sign it off. Once the Type stands firm, numbers have somewhere to hang.

MIND AI

Holding Invariance: The Removal Test

essential part (≠ M)

remove it and the Type falls apart

take the engine and wheels off a car and it is no longer a car

function-degraded part (≡ M′ ⊂ M)

remove it and function degrades

remove the air conditioning: still a car, but comfort degrades

non-essential part (≡ M)

remove it and the Type is unchanged

take off the sticker: still a car

Axiom of invariance for containers: as long as the essential parts and id(C) hold,

even when the content S(C) changes, the world model still tracks exactly the same individual.

MIND AI

Time Type: How the World Works Is a Function (Type In, Type Out)

Observe:

search, compare

(situation Type → record Type)

Predict:

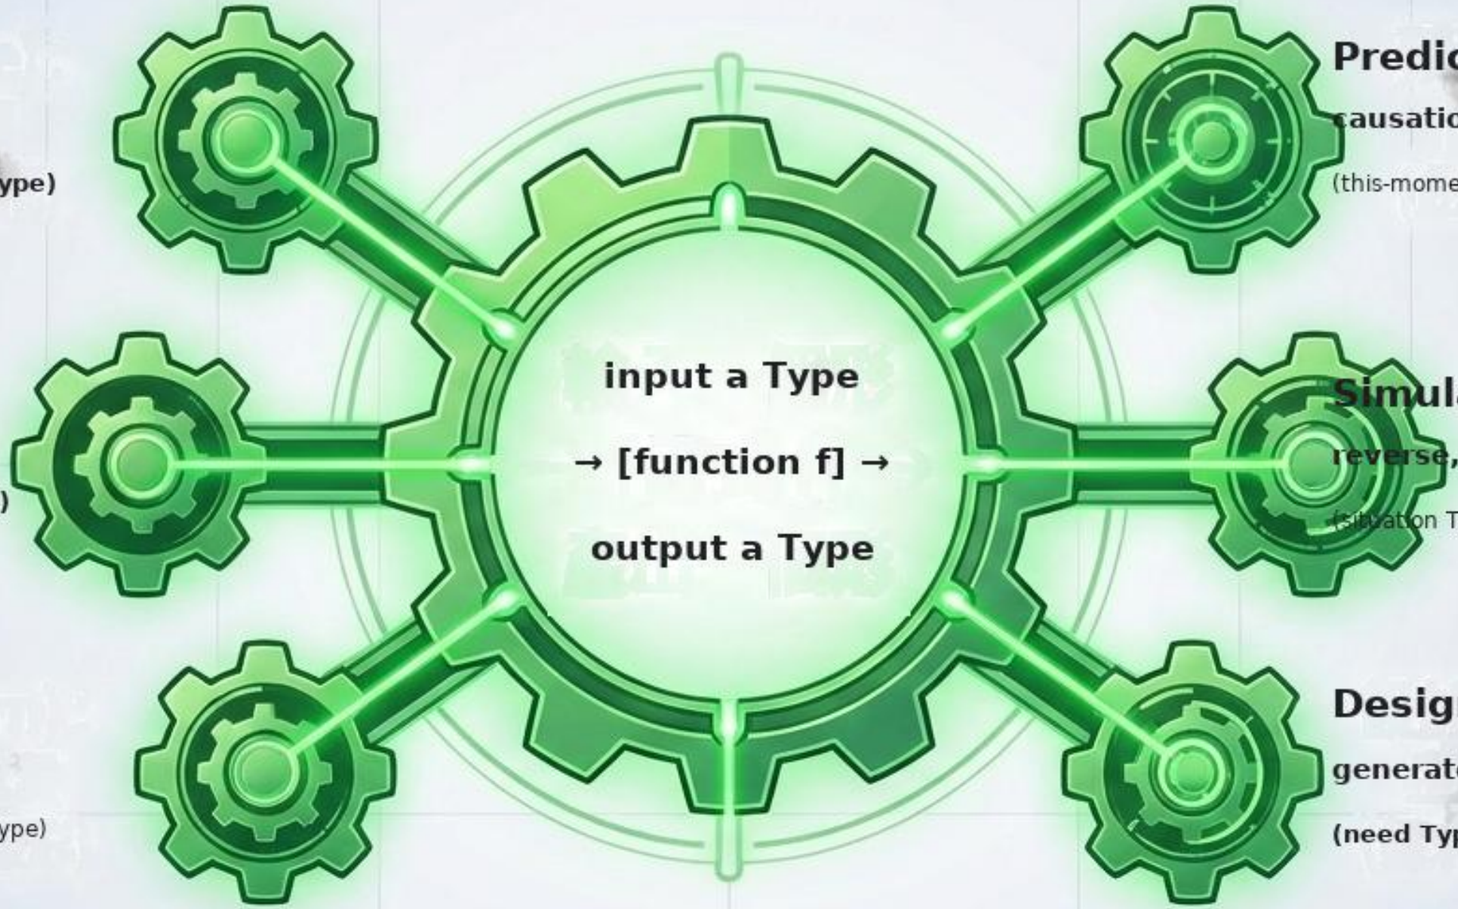

causation, statistics

(this-moment Type → next-moment Type)

Decide:

plan, solve

(situation Type → action Type)

Simulate:

reverse, derive

(situation Type → unfolded Type)

Learn:

restructure, settle

(experience Type → upgraded Type)

Design:

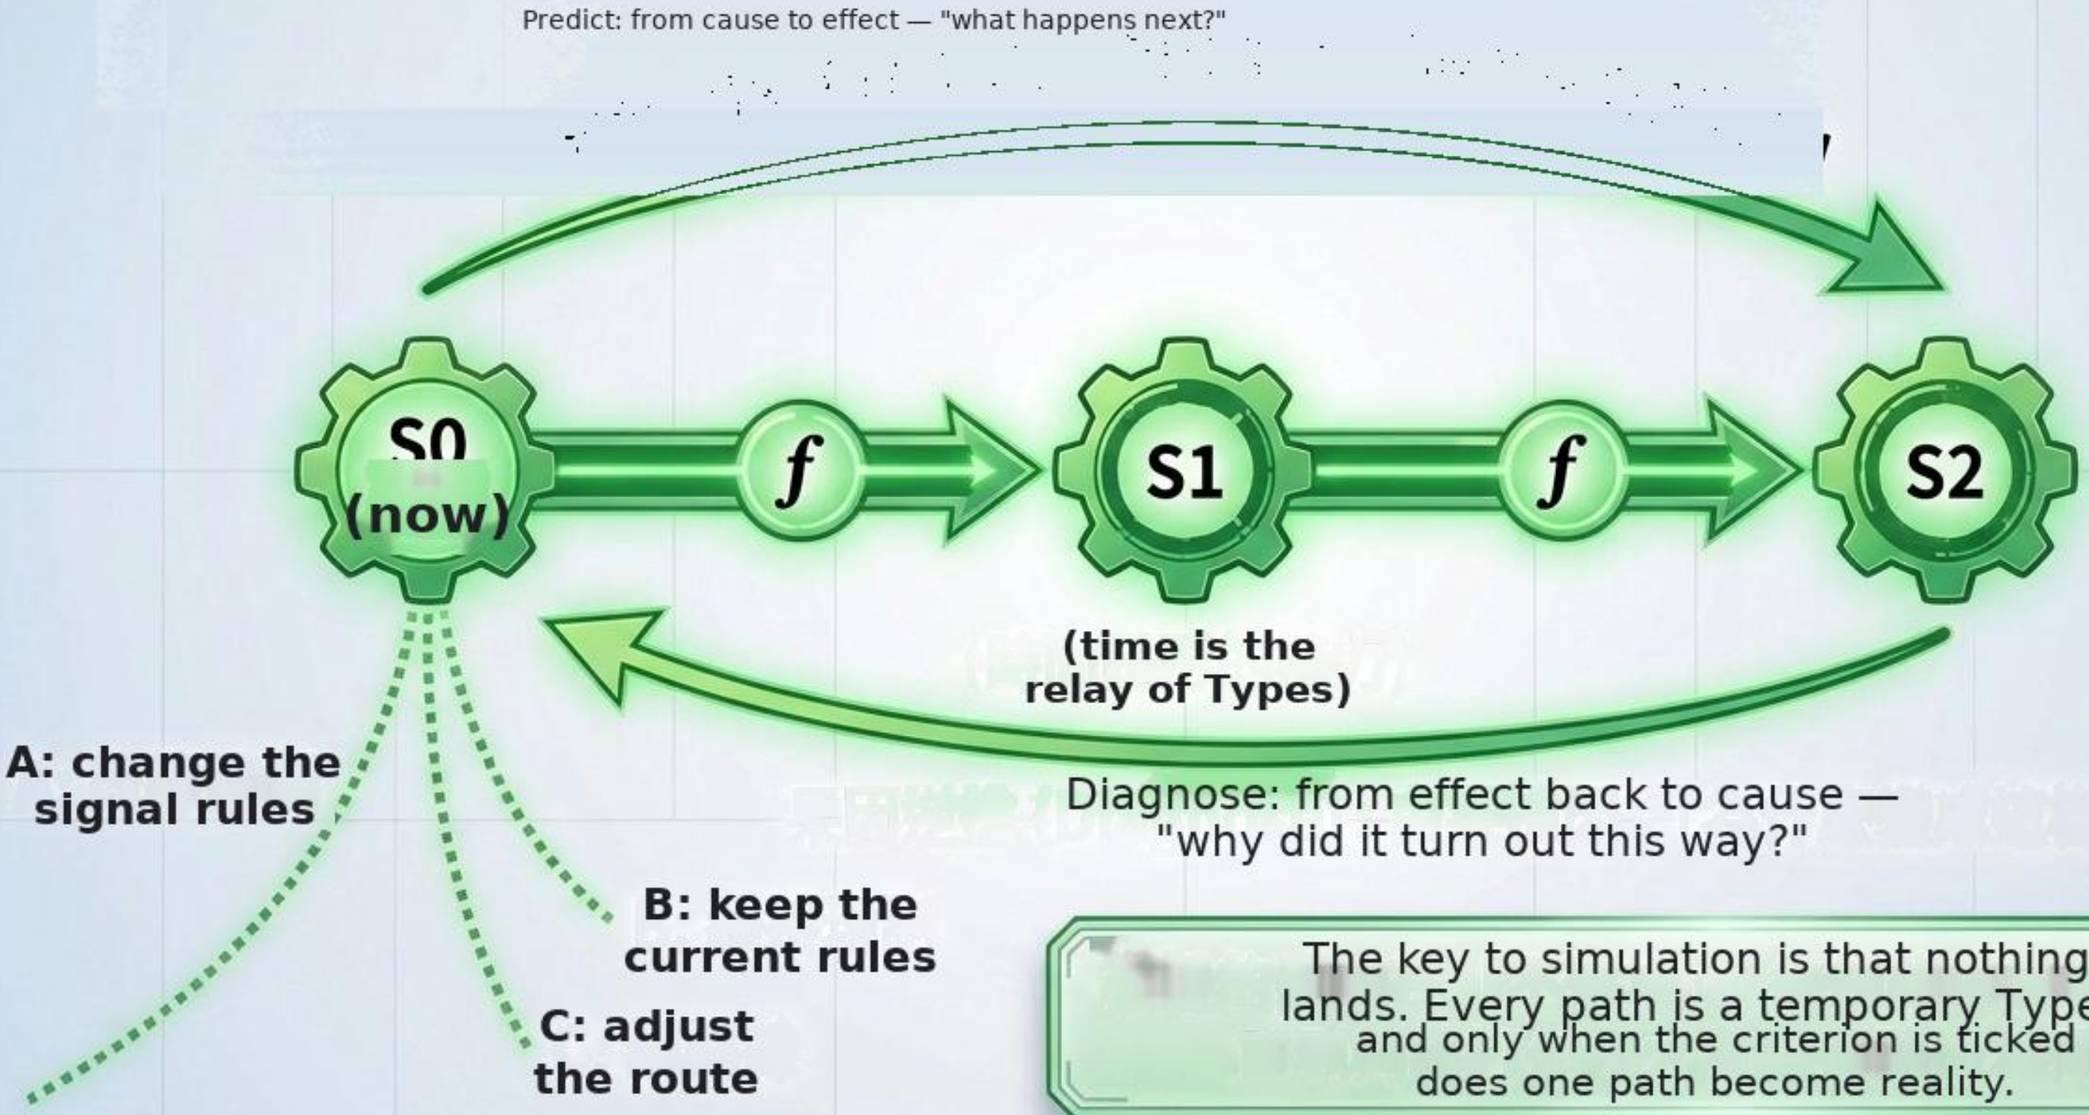

generate, combine

(need Type → plan Type)

The standard for turning a verb into a Type: all four function questions must be complete (name, input Type, output Type, criterion).

MIND AI

State Transition and Counterfactual Reasoning (What-If Simulation)

The key to simulation is that nothing lands. Every path is a temporary Type, and only when the criterion is ticked does one path become reality.

MIND AI

Three-Layer Judgement Hub: How AI Decides "What Counts as Valid"

container gate

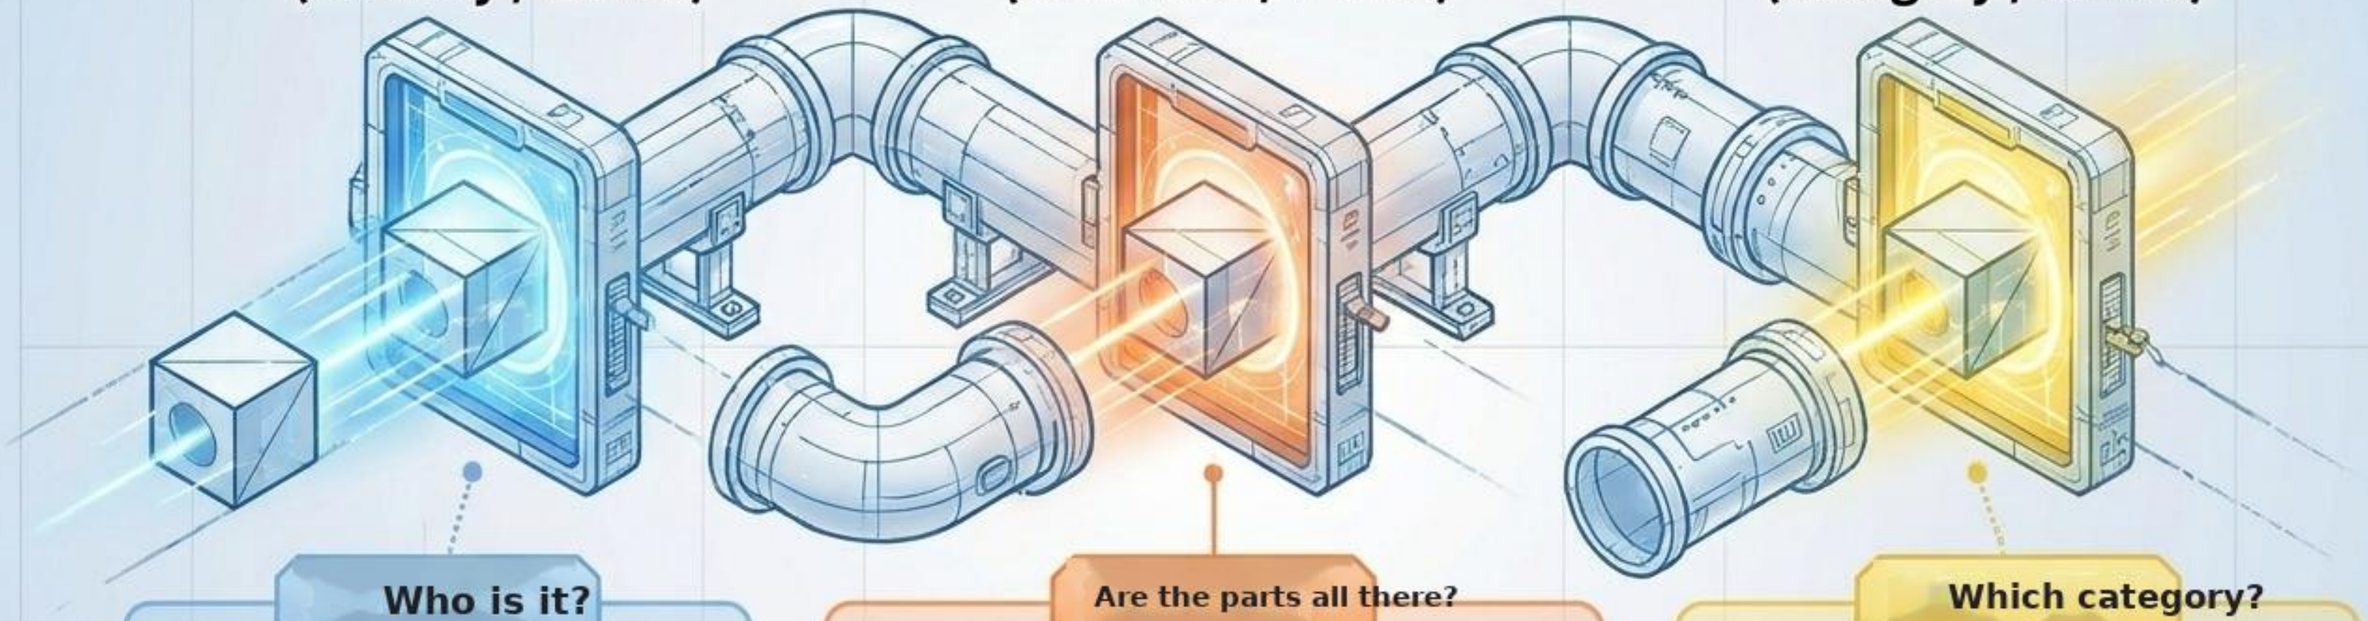

(Identity / Z-Axis)

BOM gate

(Structure / Y-Axis)

abstraction gate

(Category / X-Axis)

Who is it?

tracked by unchanged id

(is Bridge A3 still A3 ten years later?)

Are the parts all there?

removal test

(piers, deck, cables present? one missing — rejected)

Which category?

criterion T = (F(T), ∩(T))

(function and intersection match — then it belongs)

None can be skipped. Abstraction alone mixes up entities; the BOM gate alone cannot classify. Only when all three pass does the judgement count.

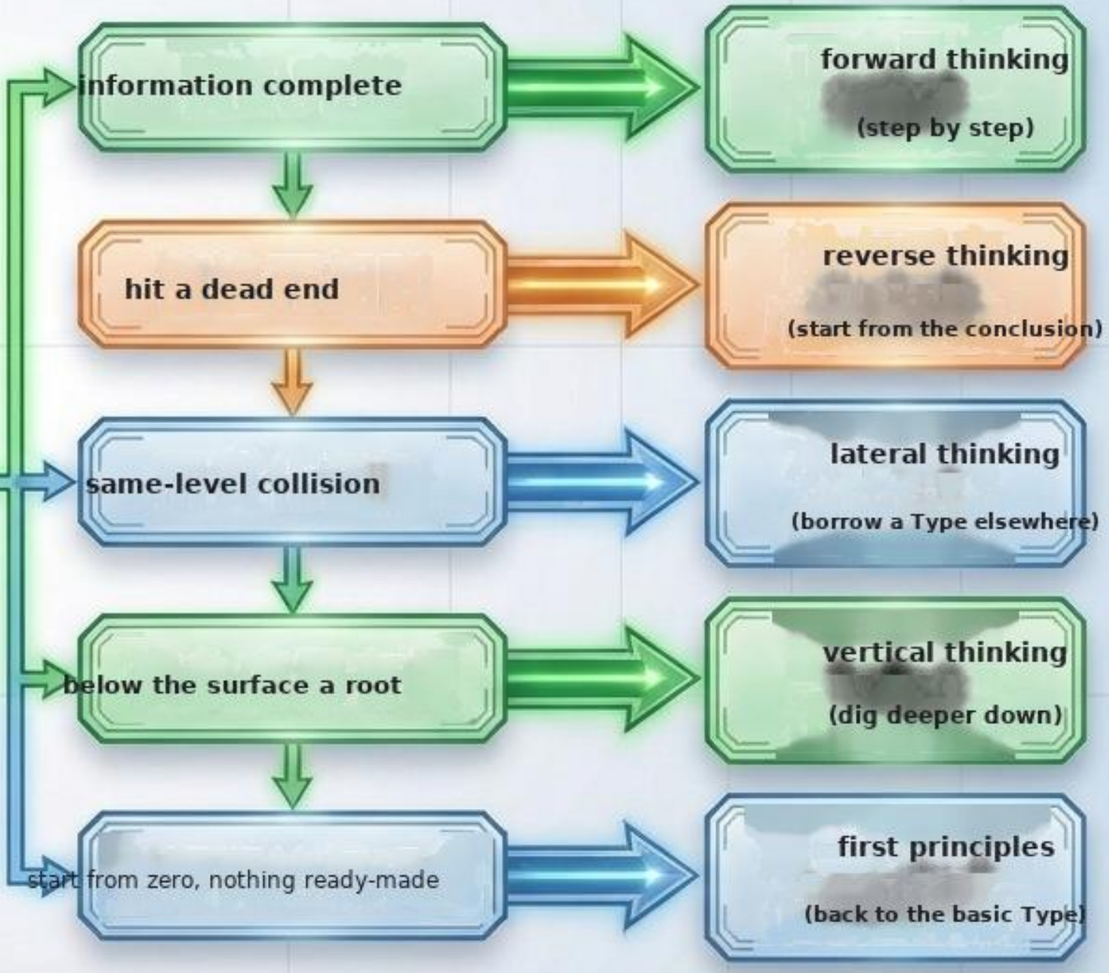

MIND AI

Thinking Methods and the Reasoning Matrix

Five Reasoning Families

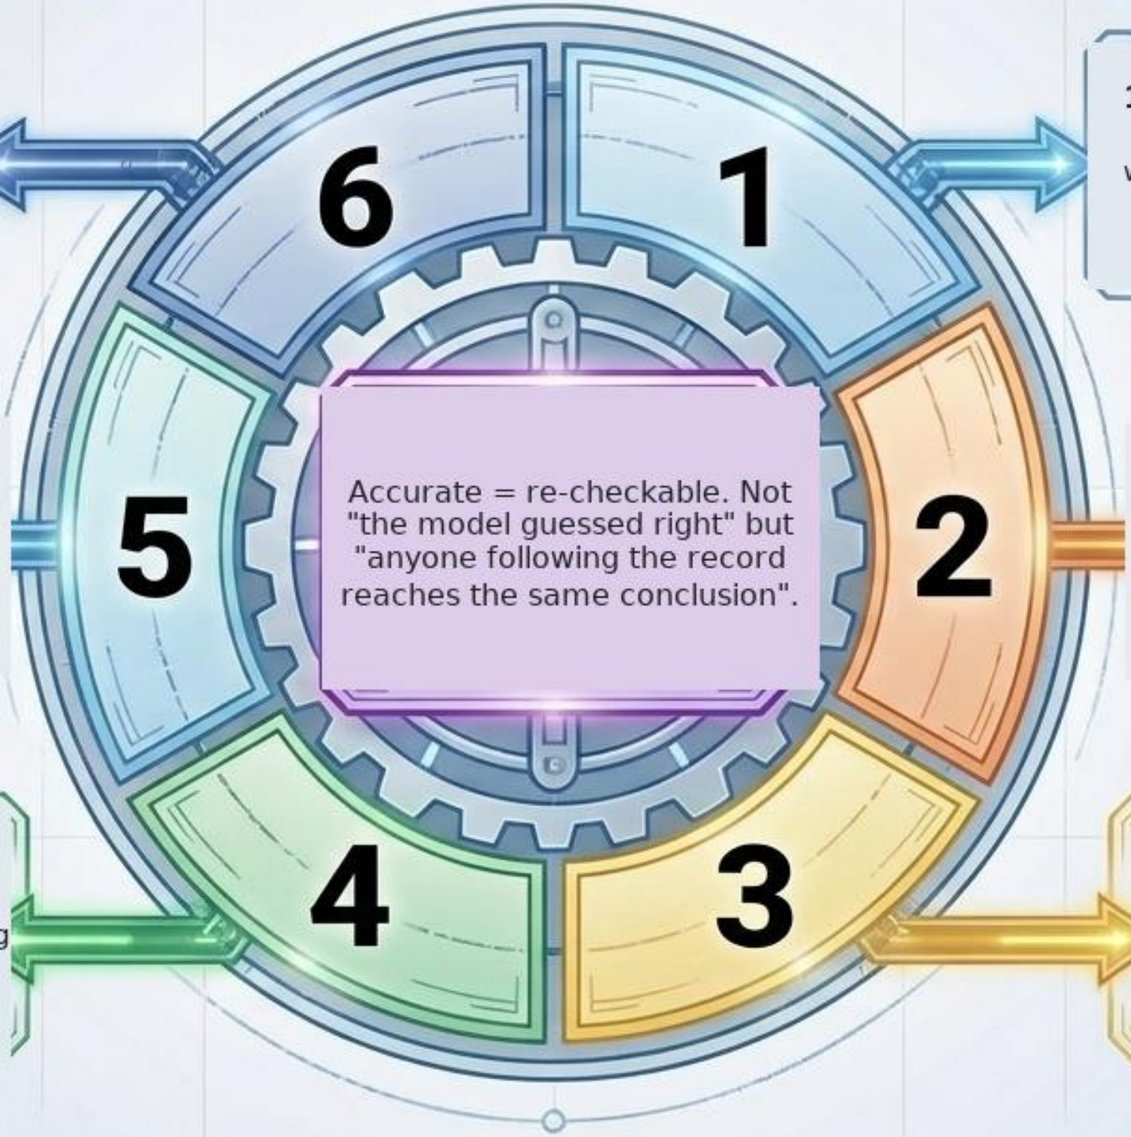

Causation	cause → effect	predict / derive (what happens next)
Root cause	effect ← cause	diagnose / root cause (why did it turn out so)
Simulation	situation → unfold	what-if reasoning (what if it were so)
Statistics	numbers → trend	distribution / trend (what holds in the majority)
Reverse	goal → work back	plan / solve (what to do first to get there)

Thinking-Method Loop

MIND AI

The Standard of Accuracy: A Re-checkable Six-Step Proof

1. Recognise:

write the Type of the task (goal, constraints, situation).

2. Axes:

describe along the X, Y, Z axes and break the task down.

3. Set Form:

write the input Type and the output Type, one line each.

4. Proposition:

choose the function, pattern and thinking method.

5. Reason:

carry out the reasoning so the process can be ticked step by step.

6. Check:

the output must pass container, BOM and abstraction gates.

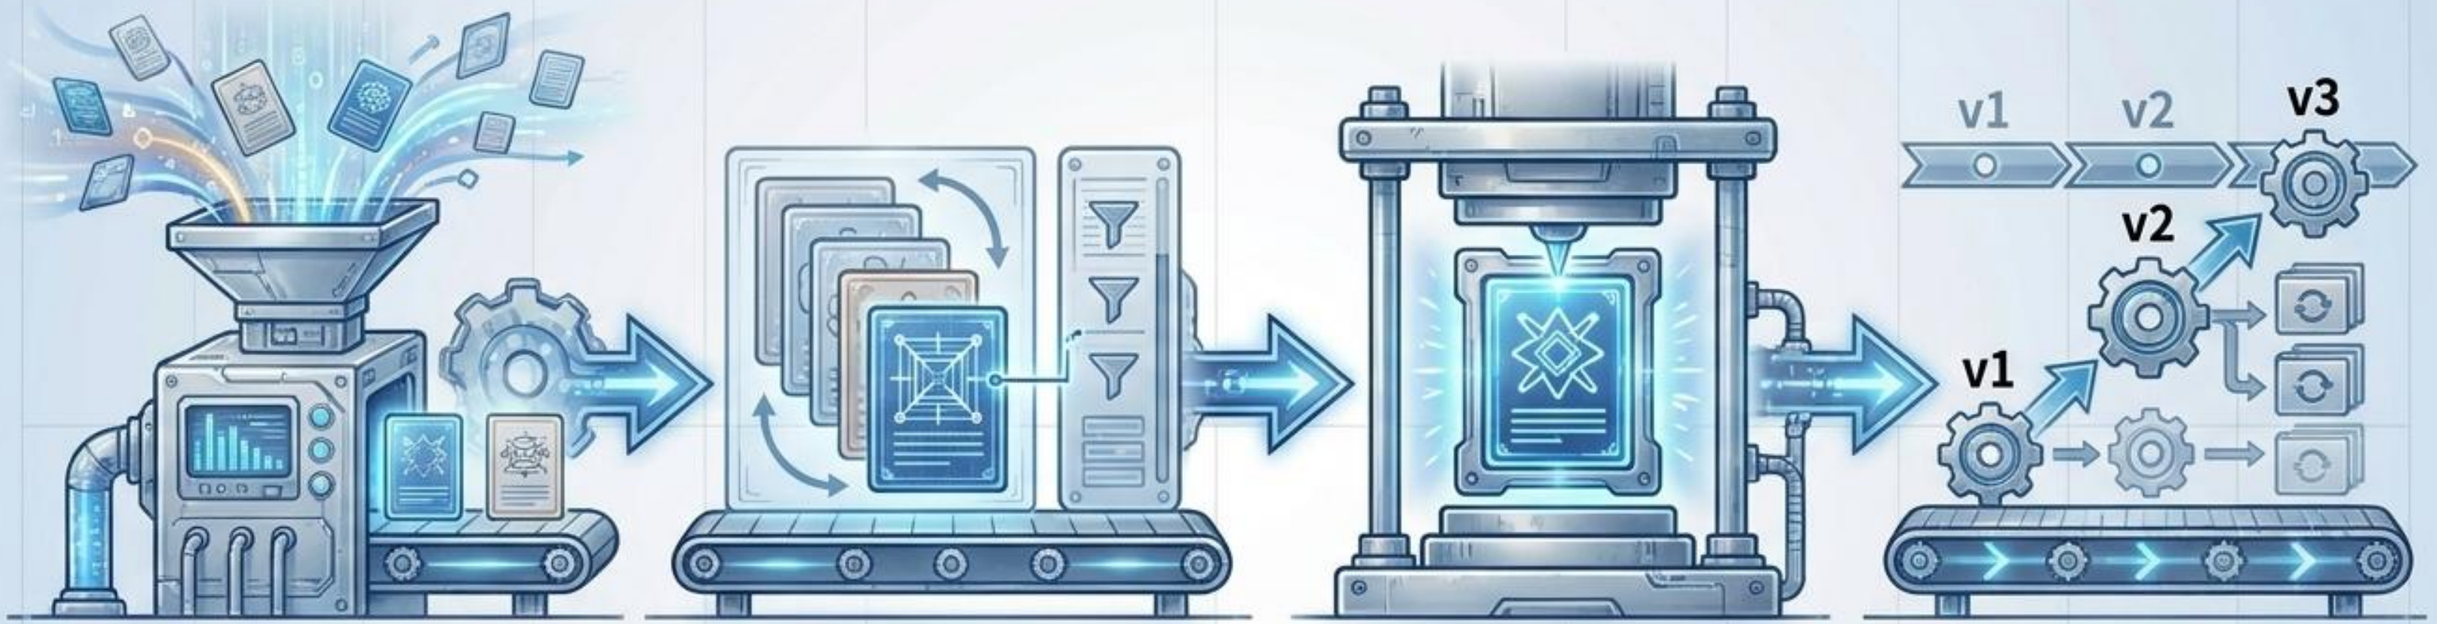

MIND AI

Pitfall Guide: Misuse and Structural Repair

[space] cannot recognise itself when split - removing an essential part breaks the Type	run the three-grade removal test, lock down the truly essential parts.
[space] numbers before the Type - rushing to compute before the Type is set	**Type first, number after.** make sure the object is written as a Type Set.
[verb] name only, four questions missing - vague instructions, everyone does it differently	force all four function questions to be complete (name, input, output, criterion)
[verb] criterion cannot be verified - vague words like "make it good"	use the [ ] property spec, write the criterion into concrete dimensions and scales.
[thinking] picking a path without walking it - a beautiful idea with no concrete reasoning	thinking methods only set direction; the real progress still needs the reasoning families, step by step.

MIND AI

Content Build Blueprint: The Line That Turns World Knowledge into Types

1. Borrow

Facing a new task, first search the library for a ready-made move, then turn what was used into a card.

2. Extract

Compare three or more similar cards and extract the common structure underneath.

3. Establish

After many validations, upgrade it into a standard, shelf-ready pattern.

4. Evolve

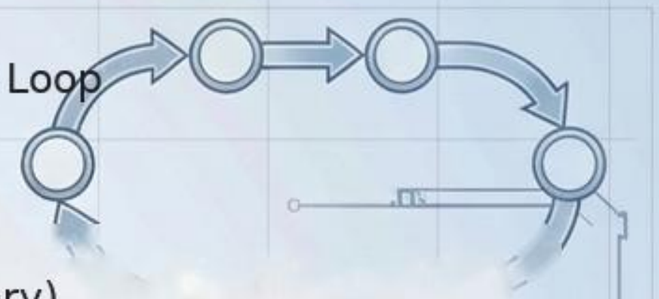

Version upgrade v1 → v2 → v3; old versions are kept, leaving a traceable path.

Twelve kinds of knowledge (physics, biology, code, even tacit rapport)

all share this one line for turning things into Types.

MIND AI

Implementation Framework: An Eight-Week Roadmap and a Five-Stage Loop

(Learn) → (Practice) → (Use) → (Teach) → (Build Type Library)

	W1	W2	W3	W4	W5	W6	W7	W8
1	Foundation: the four questions and the brain architecture (output: the first four-question card + two-library list).							
2			Core Mechanics: Space Type and Time Type (output: a Type Set, the removal test and a function card).					
					Reasoning: reasoning thought and accuracy method		(output: a route card and a full re-checkable derivation)	
4		Scale: content plan and a personal Type Library (output: an onboarding list and your own Type Library v1)						

"Small steps, fast pace" - every small step must produce a re-checkable card or Type Set.

MIND AI

The Road to AGI: Three Stages of Intelligence

Stage 1: Unity of Knowledge

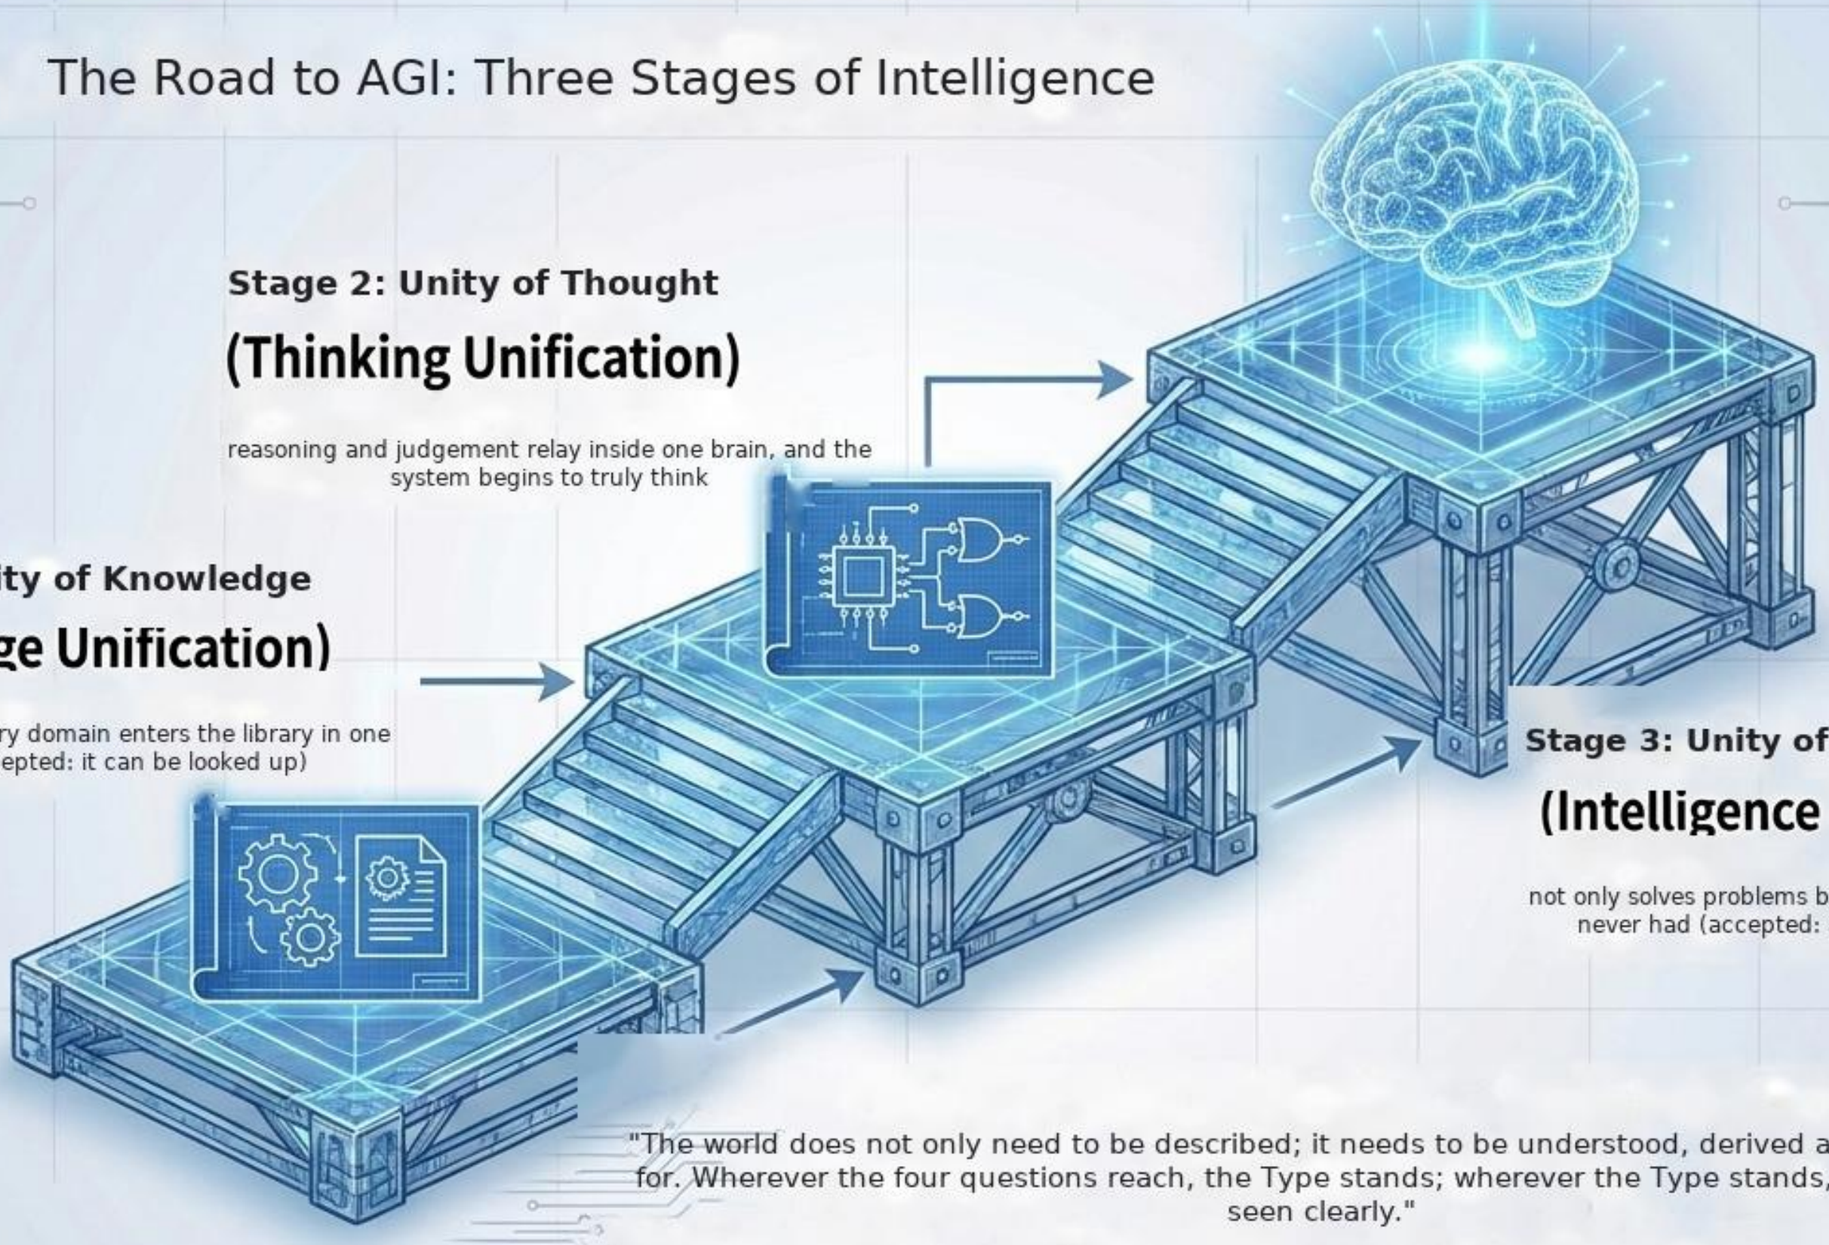

(Knowledge Unification)

knowledge from every domain enters the library in one notation (accepted: it can be looked up)

Stage 2: Unity of Thought

(Thinking Unification)

reasoning and judgement relay inside one brain, and the system begins to truly think

Stage 3: Unity of Intelligence

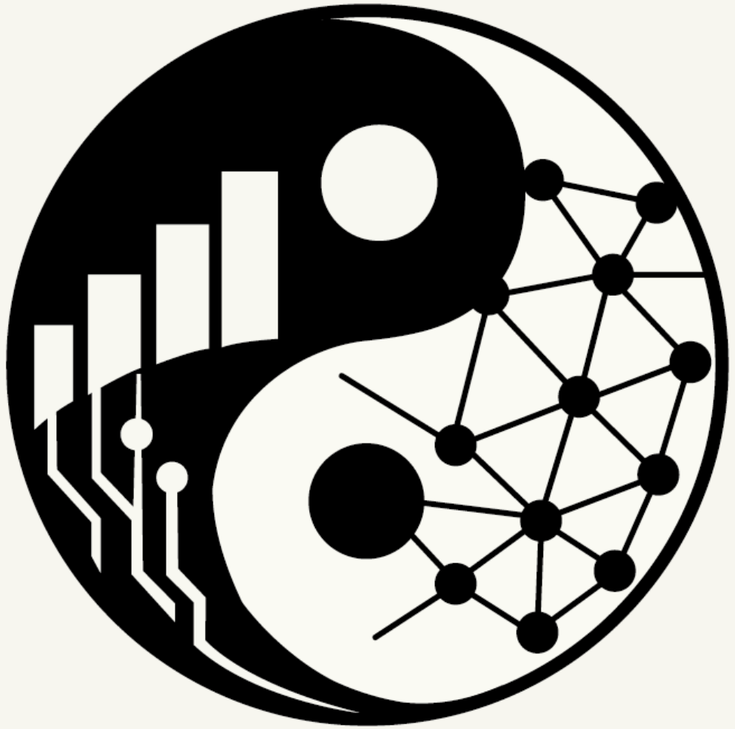

(Intelligence Unification)

not only solves problems but grows a Type the world never had (accepted: a new Type is formed)

"The world does not only need to be described; it needs to be understood, derived and answered for. Wherever the four questions reach, the Type stands; wherever the Type stands, the world is seen clearly."

MIND AI

LonGreat Vision: intelligent life that understands the essence of the world

MIND AI

"Let AI be more than a tool - a living intelligence that can truly understand, reason, learn and create."

From unified knowledge to unified thought, then to unified intelligence - this is the eternal path to AGI that LonGreat pursues.
